General Technical Report WO-21

# Preface

This report presents estimates of employment and value added in timber-based activities in the United States in 1972, 1967, 1963. Also included are data on the volume of stumpage cut, the value of logs and related products harvested, the volumes of selected timber products produced, the value of shipments from timber-based primary and secondary manufacturing industries, the value of construction, freight revenues from shipments of timber products, and wholesale and retail sales of timber products.

In basic concept, organization, and most computational procedures, this study parallels an earlier one, *The Economic Importance of Timber in the United States*, published in 1963. In most respects, the data presented are comparable with those from the 1963 study. However, in some instances, lack of new information, revisions in industry definitions, or other modifications in basic data sources have necessitated slight changes in organization or compilation procedures. Such changes, however, do not significantly affect comparability between the two studies.

The information in *Timber in the United States Economy, 1963, 1967, and 1972* is a historical record of timber's contribution to the Nation's economy. When

used in conjunction with *The Economic Importance of Timber in the United States, 1954 and 1958*, it permits complete analysis covering two decades with reference points at approximately 5-year intervals.

The estimates in this report are based on data in the 1960 and 1970 *Censuses of Population*; the 1963, 1967, and 1972 *Censuses of Business*; and various other studies and surveys conducted by the Forest Service, other government agencies, and individuals. Detailed information on sources and procedures used in computing and compiling the information presented in the report is given in the footnotes to the tables and in the appendixes.

Many people have provided assistance in the planning and preparation of this report. Special acknowledgment is given to Dwight Hair, Leader of the Demand, Price, and Trade Analysis Group, Forest Resources Economics Research Staff. Keith Blatner, William Brumm, Pat Dubose, Isabel Fisk, Timothy Frink, Christine Latonich, John Maine, and Douglas Smith assisted in collecting and compiling information for this study while temporary employees of the Forest Service.

INTRODUCTION .....	1
HIGHLIGHTS .....	4
TIMBER MANAGEMENT .....	6
Timber harvest about 11.9 billion cubic feet in 1972 .....	6
Value of stumpage cut in 1972 almost \$2.9 billion .....	6
Employment in timber management activities 117,200 in 1972 .....	7
South first in timber management employment .....	7
HARVESTING .....	9
Saw logs the most important timber product harvested .....	9
Total value of timber products harvested in 1972 some \$6.4 billion .....	10
Value added in timber harvesting \$3.1 billion in 1972 .....	10
Employment in harvesting 190,400 in 1972 .....	10
Over half of the 1972 harvesting employment in the South .....	10
PRIMARY MANUFACTURING .....	12
Lumber, plywood, woodpulp, and paper and board the most important primary manufacturing products .....	12
Value of products shipped from primary manufacturing industries \$23 billion in 1972 .....	12
Over half of shipments from pulp, paper, and paperboard mills .....	12
Value added in primary manufacturing industries \$10.1 billion in 1972 .....	14
Value added attributed to timber \$8.8 billion .....	14
Value added attributed to timber per unit of timber input highest for pulp, paper, and paperboard mills .....	14
Employment in primary manufacturing industries 487,900 in 1972 .....	15
Employment attributed to timber in primary manufacturing 426,550 in 1972 .....	16
Average value added per employee different by industry and region .....	16
SECONDARY MANUFACTURING .....	18
Shipments from selected secondary manufacturing industries in 1972 twice those in 1963 .....	18
Value added in selected secondary manufacturing industries \$34.0 billion in 1972 .....	18
Value added attributed to timber in secondary manufacturing industries \$12.5 billion in 1972 .....	18
Employment in selected secondary manufacturing industries 2.7 million in 1972 .....	19
Employment attributed to timber in secondary manufacturing industries 900,400 in 1972 .....	20
Average value added per employee highest in the paper and paperboard products industry .....	20

CONSTRUCTION .....	22
Value of construction an estimated \$159 billion in 1972 .....	22
Value added attributed to timber in construction \$11.9 billion in 1972 .....	22
Construction employment 5.3 million in 1972—795,250 attributed to timber .....	22
TRANSPORTATION AND MARKETING .....	24
Value added in transportation and marketing about \$194 billion in 1972 .....	24
Value added attributed to timber in transportation and marketing \$9.3 billion in 1972 .....	24
Employment attributed to timber in transportation and marketing 835,150 in 1972 .....	24
Average value added per employee highest in railroad transportation, lowest in retail trade .....	25
CONCLUSION .....	26
About 4.1 percent of the Nation's GNP from timber-based economic activities .....	26
One of every 25 workers employed in timber-based economic activity ....	27
APPENDIX A. TABLES .....	28
APPENDIX B. INDUSTRY DEFINITIONS .....	78
APPENDIX C. SELECTED REFERENCES .....	85

# Introduction

Timber is only one of the important products and services that the Nation derives from its forests. Forests also provide such products as minerals, wildlife, fish, water, and forage, and such diverse services as outdoor recreation opportunities and wilderness experiences. Although all of these various products and services are vital to the quality of life and national well-being, timber is the major consumable product of the forest and the primary source of forest revenues. It is also one of the Nation's most important industrial raw materials, manufactured into and consumed in many forms for many purposes ranging from housing, furniture, and toys to paper, Christmas trees, and fuelwood.

Because of its widespread use, timber is an important contributor to the U.S. economy. In 1958, about 5.6 percent, or about \$1 of every \$18, of the Nation's gross national product (GNP)—the value at current market prices of all goods and services produced by the Nation's economy—originated in some kind of timber-based economic activity. Employment attributed to timber amounted to the equivalent of 3.3 million people or about 1 out of every 20 persons employed.

Since the 1950's, there have been many changes in the management, harvest, manufacture, distribution, and use of timber and its products. Productivity has im-

proved in all phases of the timber-based economy for which data are available, new products have been developed, the relative importance of the older products has shifted, industrial production processes have been modified, methods and means of transportation have been altered, relative price relationships between timber and nontimber products have changed, and production and consumption of nearly all timber products have increased. Because of these various factors, timber's role in the Nation's economy has changed. This study was designed to measure this change by estimating timber's contribution to national, regional, and State economic activity in 1963, 1967, and 1972. The regions used in the study are the same as those used for most Bureau of the Census Surveys and are shown in figure 1.

Gross national product and total national employment are two of the most widely accepted measures of national economic activity. Both of these national measures are the sums of the contributions of the various industries and other economic enterprises across the Nation. As a consequence, the amounts of GNP and employment originating in timber-based economic activities should provide a meaningful estimate of the total economic importance of timber.

Figure 1

## Study Regions

For purposes of this study, and to facilitate comparisons with earlier studies, timber-based economic activities have been categorized as follows:

1. *Timber management.*—Activities involved in improving, protecting, and otherwise managing forest lands for the production of timber and related products.
2. *Harvesting.*—Activities involved in harvesting and transporting logs and related products from forests to local points of delivery.
3. *Primary manufacturing.*—Activities involved in the processing of logs and related products into lumber, veneer, plywood, pulp and paper, turpentine, rosin, and other products.
4. *Secondary manufacturing.*—Activities involved in the remanufacture of lumber, plywood, paper, and other products into finished goods such as furniture, toys, wearing apparel, and containers.
5. *Construction.*—Activities involved in the fabrication of lumber, plywood, and wood-based building board into houses, nonresidential buildings, and other fixed structures.
6. *Transportation and marketing.*—Activities involved in the transportation of logs and related products from local delivery points to manufacturing plants or other consumers, transportation of primary and secondary products from points of manufacture to final consumers, and the marketing of these products through wholesale and retail channels.

In order to estimate the contribution of each of these activities to total GNP, the economic concept of value added was used. Value added is defined as the difference between the value of goods produced by an enterprise and the costs of materials and supplies that are used in producing them. It represents the amount available for wages and salaries of workers, interest, rent, profits, taxes, dividends, and depreciation expenses. The sum of the values added by all of the enterprises in any particular sector of the economy is equal to that sector's contribution to GNP, the sum of values added in all sectors being equal to total GNP.

In timber management and harvesting, as defined in this report, all of the values added and employment were considered to be timber based and thus were attributed to timber. In those enterprises engaged in manufacturing, construction, transportation, and trade, where both

timber- and nontimber-based materials were used or handled, only a portion of the total value added and employment were attributed to timber. For these enterprises, estimates of total value added and employment and of value added and employment attributed to timber are presented. The sum of the values added and employment attributed to timber is considered to represent that part of the GNP and national employment originating in timber-based economic activities.

As shown in the table footnotes, data on value added and employment for the manufacturing industries were derived from the 1963, 1967, and 1972 *Censuses of Manufactures*. For these industries, it was assumed that estimates of value added and employment attributed to timber could be derived by using the ratios between the cost of timber products as a raw material and the total cost of all raw materials that were incorporated into the final product. For example, in the wood household furniture industry—where lumber, plywood, particleboard, veneer, and other wood-based products composed about 60 percent of the total cost of materials used in 1972—60 percent of the total value added and employment was attributed to timber. The remaining 40 percent was attributed to glass, plastics, metals, textiles, and other non-wood materials used in making the final products. In contrast, only about 5 percent of the value added and employment in metal household furniture was attributed to timber and 95 percent to other materials.

In some secondary manufacturing industries, allowances were made for nontimber raw materials used in earlier processing stages. For example, only 85 percent of the cost of the paper and paperboard consumed was used in the allocation of value added and employment. The remaining 15 percent of the cost of the paper and board input was considered to be allocatable to straw, cotton, bagasse, clay, or other nontimber raw materials used in paper and paperboard manufacture in the earlier processing stages.

In some manufacturing industries, detailed information on value of materials consumed was not available. In those cases, estimates of value added and employment attributed to timber were based on value or quantity of goods produced. For example, in the women's and misses' dresses industry, where an estimated 15 percent of the dresses produced were chiefly from rayon or acetate, 15 percent of the value added and employment were attributed to timber.

The estimates of value added and employment attributed to timber were computed for all primary and secondary manufacturing industries where timber products represented more than 2.5 percent of the total cost of materials used or handled. In numerous other manufacturing industries, where cost of timber products consumed was less than 2.5 percent, no separate industry

estimates of value added or employment were computed, nor was an attempt made to show total value of product shipments. However, estimates of the aggregate value added and employment attributed to timber in such industries were made. These were based on estimated volumes of timber-based materials consumed in these industries and on the ratios of value added and employment attributed to timber per unit of wood consumed in those secondary manufacturing industries in which timber composed more than 2.5 percent of materials cost.

Estimates of value added and employment attributed to timber in construction were derived by multiplying estimates of total value added and employment by the ratios of cost of timber products construction materials to cost of total materials by type of construction. For the transportation and trade sectors, estimates of value added and employment attributed to timber were derived by multiplying estimates of total value added and employment by the ratio of freight revenue from timber products and total freight revenue, and sales of timber products and total sales, respectively.

Although this study measures some of the same factors (value added and employment) measured in input-output studies and used in the construction of input-output tables, it is not an input-output study. As a consequence, no interindustry transactions matrix has been constructed and it is not possible to measure, for example, the effects on the timber-based sectors of a change in final demand through the use of multiplier analysis. In addition, interstate, interregional, and international flows of mate-

rials between sectors have not been estimated. Thus, although the statement can be correctly made that for every dollar of stumpage cut in a State, or region, an additional  $X$  dollars of value is added in other timber-based economic activities, it should not be implied that the additional value added has been generated by timber from that State or region.

The data used in this study have been derived from a great number of diverse sources. In some cases, it was necessary to make estimates for States based on regional averages, or for regions based on national data. Consequently, the more aggregative data are likely to be the most reliable. In others, such as for management and harvesting, the Standard Industrial Classification scheme for establishments was departed from in favor of a more activity-oriented approach. This required modifications in the primary manufacturing data derived from the *Censuses of Manufactures*, partly on a judgmental basis, as discussed in the primary manufacturing section. It was also necessary, for some items, to make estimates based on trends when data for 1963, 1967, or 1972 were not available. Finally, because the Nation's economic system is dynamic and changes from year-to-year, some apparent trends shown by the data may be the result of temporary changes in the overall economy rather than structural changes in the timber economy. Despite these limitations, it is believed that the estimates presented in the report will provide a more complete understanding of the importance of timber and timber-based activities in the Nation's economy.

# Highlights

The estimated stumpage value of the timber cut in the United States in 1972 was about \$2.9 billion (table 1), more than double the estimated \$1.3 billion harvest in 1963. The timber products harvested from this stumpage, along with related products such as Christmas trees and pine gum, were valued at \$6.4 billion. In total, about 307,000 were employed in timber management and harvesting in 1972.

The net contribution to the GNP of the enterprises included in this study is shown in terms of value added—the difference between the costs of goods purchased by an enterprise and value of products sold. All of the values added and employment in timber management and in harvesting were considered to be timber-based and thus were attributed to timber. However, in those enterprises in manufacturing, construction, transportation, and trade, where both timber and nontimber materials were used or handled, only a part of the total value added and employment originated in timber-based activities and was attributed to timber.

The value of shipments from primary manufacturing industries (sawmills and planing mills; veneer and plywood plants; pulp, paper and paperboard mills; and other primary manufacturing plants such as cooperage-stock mills and particleboard plants) amounted to \$23 billion in 1972. Value added in primary manufacturing amounted to \$10.1 billion and that attributed to timber to \$8.8 billion. Total employment in primary manufacturing was 488,000. Of that total, 427,000 was attributed to timber.

Shipments from selected secondary manufacturing industries (paper and paperboard products, furniture, millwork and prefabricated wood products, and wooden containers industries) totaled \$35.5 billion. The value added attributed to timber in these industries amounted to \$12.5 billion in 1972. Employment attributed to timber totaled 900,000.

In construction, the total value of products produced (as measured by construction expenditures) was about \$159 billion. Total value added amounted to \$79.6 billion and that attributed to timber \$11.9 billion. Employment in construction was an estimated 5.3 million, with some 795,000 attributed to timber.

The total value added in transportation and marketing was an estimated \$194.2 billion. About \$9.3 billion of this was attributed to timber. Total employment was 18.7 million, that portion attributed to timber about 835,000.

Overall, the value added in all types of timber-based economic activities was almost \$48.5 billion in 1972, or about 4.1 percent of the Nation's GNP. Employment attributed to timber in 1972 was about 3.3 million, or about 4.0 percent of all civilian employment in the United States. In 1963, about 4.4 percent of the GNP and 4.5 percent of total employment were estimated to be timber-based.

Table 1.—Estimated value of product or service, total value added and employment, and value added and employment attributed to timber in timber-based economic activities in the United States, 1972, 1967, and 1963

<sup>1</sup> Value of product or service: timber management—value of stumpage cut; harvesting—value of timber products harvested; primary and secondary manufacturing industries—value of shipments; construction—total construction value including new and estimated maintenance and repair; wholesale and retail trade—total sales.

<sup>2</sup> Not available.

# Timber Management

For purposes of this study, timber management is defined as the process of improving, protecting, and otherwise managing forest lands for the production of timber and related products. It includes such activities as timber stand improvement; tree planting; protection of forests from fire, insects, and other destructive agents; timber sales activities; and education, consultation, planning, and research related to timber management and timber products.

Timber management activities have grown rapidly during the past few decades as public resource agencies and timber industries have expanded and intensified their programs. In addition, through various public and private educational and technical assistance programs, nearly all landowners have been afforded the opportunity to manage their timber resources more effectively. Moreover, nearly all U.S. commercial timberland is now protected against wildfires by some type of organized fire control program. As a result of these various measures, most of the timber currently harvested in the United States represents to some degree the product of management.

## Timber harvest about 11.9 billion cubic feet in 1972

In 1972, some 11.9 billion cubic feet of timber was harvested from U.S. forests (table A-1, fig. 2). This represented an increase of about 12 percent from production in 1963, and 7 percent more than in 1967.

About 47 percent of the total cut (5.6 billion cubic feet) came from forests in the South, 40 percent (4.7 billion cubic feet) from the West, and 13 percent (1.5 billion cubic feet) from the North. For the South, the cut in 1972 represented a large increase since 1963, both in volume and proportion of the U.S. total. The volume cut rose nearly 1.2 billion cubic feet, and the proportion of total increased by some 5 percent. The volume harvested in the West also increased, rising almost 0.4 billion cubic feet. However, the amount cut in 1972 represented a somewhat smaller percentage of the U.S. total than did the 1963 harvest. The North showed a decline in both volume and proportion of total cut.

Oregon topped all the other States in total volume cut in 1972, followed closely by Washington, also in the Pacific region. These two States held the same relative positions in 1963 as well. California was the third largest producer in both years. The volume of timber cut in Alabama was largest for any State outside the Pacific Region in 1972. The Georgia harvest was next largest in the South. This was a reversal of the situation in 1963 when Georgia led the South and Alabama was second. Among the Northern States, the largest volume was cut in Maine in both 1972 and 1963.

The volume of, regional distribution of, and trends in timber harvests are due to a number of complex interacting demand and supply factors. For example, demand for hardwood timber, over half of which was growing in northern forests in the late 1960's, has declined somewhat over the past three decades. Conversely, markets for softwood timber, largely a product of western and southern forests, have increased. Timber size, timber quality, ownership patterns, and industry and market locations have also been important. Continued shifts can be expected as the relative importance of these various factors change.

## Value of stumpage cut in 1972 almost \$2.9 billion

The stumpage value of the timber cut from U.S. forests in 1972 is estimated at about \$2.9 billion—more than double the value in 1963 and 95 percent above 1967 (table A-1, fig. 2). This sharp increase in total value was the result of not only the rise in volume harvested but also an even larger jump in average value. As shown in the tabulation below, average value per hundred cubic feet for all stumpage cut was about \$24.10 in 1972, more than 90 percent above the 1963 average.

Region	Average value of stumpage cut		
	1972	1967	1963
	(dollars per 100 cubic feet)		
North	11.72	8.14	7.52
South	17.07	10.48	9.33
West	36.48	18.49	18.05
United States	24.10	13.24	12.64

Although the total value of stumpage cut increased in the North, South, and West between 1963 and 1972, the percentage contribution of each to the national total changed markedly. For example, the West, which accounted for about 51 percent of the total in 1963, jumped to over 60 percent in 1972. In contrast, the South dropped from 35 to 31 percent, despite large increases in both volume and value. The North experienced a decline to 7 percent. These changes in relative share are due to the various factors outlined above and to the differences in timber species and quality between the regions. Much of the timber harvested in the Pacific Coast States was old-growth softwood sawtimber, high in demand for manufacture into plywood and lumber, principally for housing and other construction purposes. On the other hand, much of the timber cut in the East was from relatively young forests and was, with some exceptions, of a

somewhat smaller size and lower quality. As a result of these factors, average stumpage price in the West doubled between 1963 and 1972, southern prices increased about 83 percent, and prices in the North rose 56 percent (see tabulation above). Most of the rise in all regions came between 1967 and 1972.

In this study, it has been assumed that the value of stumpage cut is the same as the total value added and the value added attributed to timber management activities. There are undoubtedly some costs for intermediate products used in timber management, such as supplies used in planting and fire control that conceptually should be deducted. However, much of the activity involved is labor intensive, and the data available indicate that the intermediate product costs are relatively small in comparison with the value of stumpage cut. Consequently, no deductions were made.<sup>1</sup>

### Employment in timber management activities 117,200 in 1972

The equivalent of about 117,200 people is estimated to have been employed in timber management activities in 1972 (table A-2). This total includes estimates of the

<sup>1</sup> Hair, Dwight. The economic importance of timber in the United States. U.S. Dep. Agric. For. Serv. Misc. Publ. 941, 91 p. 1963.

full-time equivalent for part-time employees and timberland owners. Although no exact number is available, it is estimated that about 20,000, or 17 percent of the total, were professional foresters. The remaining employment, including that of forest owners, involved a variety of tasks such as firefighting, tree planting, and planning sales and other management activities.

Employment in timber management is estimated to have increased about 24 percent—the equivalent of 22,500 workers—between 1963 and 1972. The largest part of this rise, about 13,000, came between 1963 and 1967, and involved increases in both government and private employment. Between 1967 and 1972, some slowing occurred, particularly in Federal employment.

In all 3 study years, about 60 percent of the total employment is estimated to have been in or funded by Federal, State, and local government agencies and about 13 percent in forest products industries.

### South first in timber management employment

In 1972, as well as 1963 and 1967, about a fourth of the total employment was in the North, a third in the West, and the remaining two-fifths in the South (fig. 3). Employment by the Federal government was highest in the West and timber-owner employment highest in the East, because of existing land-ownership patterns.

Figure 2

### Volume and Value of Stumpage Cut, 1972

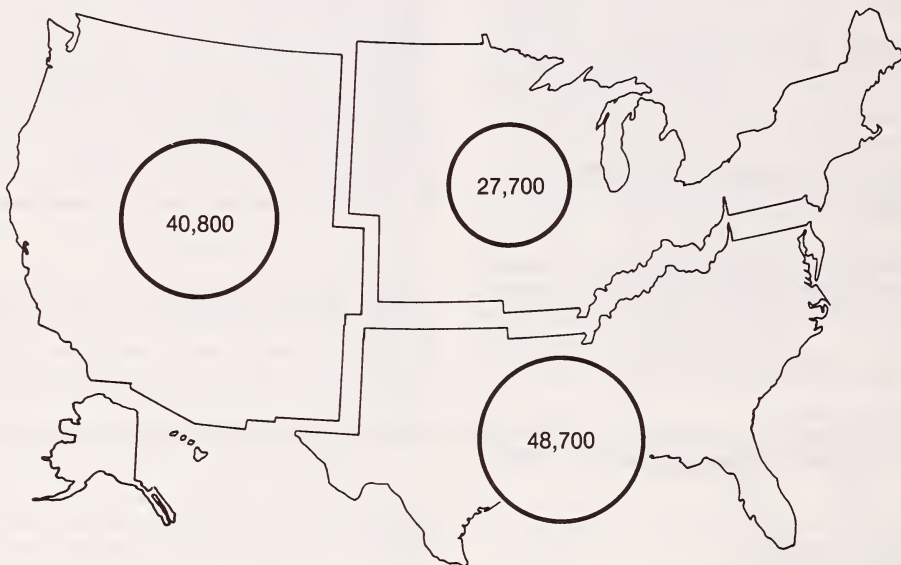

In so far as possible, estimates of employment in timber management were based only on those involved in activities directly related to the growing of trees for timber. However, timber management activities include many functions other than those directly related to the production of timber and to timber sales. The data

presented here undoubtedly include some employment that might better be attributed to wildlife, water, range, or some other forestry activity, related but not directly attributable to timber production. As in the case of stumpage, all of the employment in timber management activities is attributed to timber.

**(Total 117,200)**

# Harvesting

In this study, harvesting includes felling trees, cutting them into logs, cutting or collecting such miscellaneous timber products as Christmas trees and pine gum, and transporting these products to local delivery points such as rail yards, barge landings, and processing points.

## Saw logs the most important product harvested

In 1972, about 5.9 billion cubic feet of saw logs, 3.6 billion cubic feet of pulpwood, 1.4 billion cubic feet of veneer logs, and 0.95 billion cubic feet of other round timber products such as cooperage logs, poles, piling, fuelwood, and fence posts were harvested from U.S. forests (table A-3, fig. 4). This represented an increase since 1963 of about 9 percent for saw logs, 52 percent for veneer logs, and 36 percent for pulpwood. Only the harvest of "other" timber products dropped during the period, mainly because of the continued decline in fuelwood output.

The South accounted for about 47 percent of the total roundwood harvest in 1972. This was up sharply from 42 percent in 1963 and was due to large increases in pulpwood and veneer log output and to a somewhat smaller rise in saw log production. Much of the over fourfold increase in veneer log production resulted from the rapid development of the southern pine plywood industry.

About 72 percent of the total pulpwood harvest came from Southern forests in 1972, a somewhat larger proportion than in 1963. Over half of the "other" roundwood products also was cut in the South.

About 4.7 billion cubic feet of roundwood products was harvested in the West in 1972, some 40 percent of the national total and slightly below the 41 percent produced in 1963. The West produced the largest volume of saw logs in all 3 study years. Most of these were harvested in the Pacific Coast States of Oregon, Washington, and California. Output in the North dropped about 12 percent between 1963 and 1972, primarily as a result of declines in the harvests of veneer logs and "other" products. In total, about 13 percent of the Nation's roundwood output came from the North in 1972, somewhat less than the 16 percent produced in 1963.

Oregon, Washington, and California led all States in the harvest of both saw logs and veneer logs in 1963 and 1967. By 1972, however, with the emergence of the softwood plywood industry in the South, Louisiana became the third leading veneer log producer. Alabama was the number one total producer of all roundwood products outside the Pacific region in 1972. Maine led the North in saw log, veneer log, and pulpwood output, and Missouri had the largest volume of "other" products.

Figure 4

## Volume and Value of Round Timber Products Harvested, 1972

The total value of round timber products harvested in 1972 is estimated at \$6.3 billion (fig. 4) about 98.6 percent of the value of all products discussed in the following section.

### **Total value of timber products harvested in 1972 some \$6.4 billion**

The total value of timber and related products harvested from U.S. forests in 1972 was an estimated \$6.4 billion (table A-4.) This was almost double the estimated value in 1963 and 80 percent larger than in 1967. The somewhat larger increase in total value than in timber products output during the study period was due to the rapid rise in average value for most products, particularly between 1967 and 1972.

In 1972, saw logs accounted for about 58 percent of the total value of the timber products harvested; veneer logs 21 percent; pulpwood 16 percent; and the "other" products such as fuelwood, poles, piling, pine gum and Christmas trees, the remaining 5 percent. This was somewhat different from the distribution in 1967 and 1963, when the total value of pulpwood harvested exceeded total veneer log value.

The West, which led all other sections of the Nation in total value of timber products harvested in each of the 3 study years, increased its share of the total from 52 to 55 percent between 1963 and 1972. This was primarily due to the relatively more rapid increase in average saw log and veneer log value for Pacific Coast species. The South was next in order of importance.

### **Value added in timber harvesting \$3.1 billion in 1972**

The total value of the timber and related products harvested represents, in part, the costs of stumpage and of the intermediate products used in harvesting and transportation to local points of delivery. When these costs are deducted from the total value of timber products harvested, the value added in harvesting (and the value added attributed to timber) amounted to an estimated \$3.1 billion in 1972, double the \$1.5 billion added in 1963 (table A-5).

In 1972, about 55 percent of the total value added (also value added attributed to timber) was in the West, 36 percent in the South, and 9 percent in the North. This was somewhat different from the distribution of the value of timber products harvested, in part because of regional differences in logging methods and average wage rates.

### **Employment in harvesting 190,400 in 1972**

In 1972, the equivalent of 190,400 people were employed in timber harvesting activities (table A-6, fig. 5). This was a decline of more than 86,000 from total employment in 1963 and was primarily due to continuing improvements in logging productivity across the Nation as well as declines in some of the more labor intensive activities such as pine gum gathering.

The estimates of logging employment presented here are substantially larger than estimated employment in the Logging Camps and Logging Contractors Industry (SIC 2411) shown in the 1963, 1967, and 1972 *Censuses of Manufactures*. This is because of differences in definitions and coverage. The Census estimates included only the employees of independent loggers and contractors and excluded the logging employees of primary manufacturing enterprises such as sawmills and pulpmills, farmers and other part-time loggers, and workers engaged in harvesting such miscellaneous products as pine gum. The estimates presented here, on the other hand, were derived by using timber products output data and estimated regional productivity factors and therefore include all harvesting employment.

### **Over half of the 1972 harvesting employment in the South**

About 51 percent of the 190,400 people engaged in harvesting in 1972 were employed in the South, mostly in the production of pulpwood (tables A-6, and A-7). Another 25 percent of those employed in harvesting were in the West and were largely engaged in saw log production. Pulpwood production was also the most important harvesting activity in the North, followed closely by saw log harvesting.

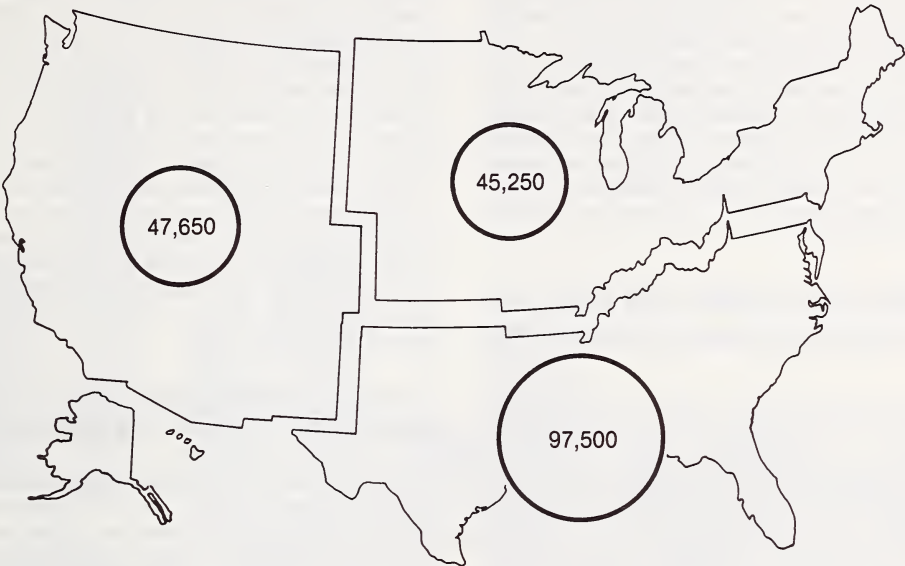

The distribution of harvesting employment among the regions reflected both the volume and types of products harvested and the differences in labor productivity. Productivity as measured by output per person-year of employment was estimated to be much larger in the West than in the South or North. Harvesting of most products in the West tended to be more efficient because of the relatively larger scale of most operations and the fact that much of the logging was in stands of larger trees with higher average volumes per acre.

Oregon, with about 17,000 people employed in 1972, was the leading State in harvesting employment (table A-7). Georgia was the second ranked State, followed by Alabama, both in the South. Maine was the leading northern State in total harvesting employment.

Figure 5

**Employment in Timber Harvesting, 1972**  
**(Total 190,400)**

# Primary Manufacturing

Some of the products harvested from the Nation's forests, such as fuelwood and Christmas trees, are ready for use and need only be marketed or transported to the final consumer. However, most, such as saw logs, veneer logs, and pulpwood, are manufactured into lumber, plywood, wood pulp, and other similar items.

This primary manufacturing is carried out in a group of enterprises that have been classified in this study as the sawmills and planing mills industry; the veneer and plywood industry; the pulp, paper and paperboard industry; and "all other"—a grouping of various enterprises manufacturing such diverse timber products as excelsior, wood shingles, cooperage stock, particleboard, and gum and wood chemicals.<sup>2</sup>

## Lumber, plywood, woodpulp, and paper and board most important primary manufacturing products

The most important products of the primary manufacturing industries in 1972 were 31 billion board feet of softwood lumber, 6.8 billion board feet of hardwood lumber, 18.3 billion square feet (3/8-inch basis) of softwood plywood, 2.1 billion square feet (3/8-inch basis) of hardwood plywood, and 46.8 million tons of woodpulp (tables A-8, A-9, and A-10). In addition, these industries produced about 59.5 million tons of paper and board (mostly from woodpulp); 3.1 million square feet (3/4-inch basis) of particleboard; 1.6 million drums of rosin (520 pound net basis); 566,000 barrels (50 gallon basis); 531,000 tons of charcoal briquets; and numerous other products.

For most products, the volume produced in 1972 represented substantial increases over output in 1967 and 1963. For example, between 1963 and 1972 particleboard production increased sixfold, softwood plywood production 79 percent, woodpulp production 55 percent, paper and board 52 percent, hardwood plywood 25 percent, and softwood lumber 12 percent. The only solid wood product to exhibit a decline was hardwood lumber with a drop of about 5 percent. Turpentine and rosin output were also down.

The geographic distribution of production varied for the individual products, and some exhibited important regional shifts during the years covered by the study. In 1972, about 71 percent of the softwood lumber and softwood plywood was produced in the West, principally in Washington, Oregon, and California. For softwood lumber, this was only slightly less than the 73 percent pro-

duced in the West in 1963. For softwood plywood, however, the proportionate shift of production to the South was dramatic after production started in that region in 1964. About 63 percent of hardwood lumber production and 43 percent of hardwood plywood output were from mills in the South in 1972. For both products, this represented a slightly smaller proportion than in 1963. Hardwood lumber production showed a small shift to the North, while the West gained in the relative proportion of hardwood plywood output at the expense of both the other two regions. This came despite the lack of a large domestic hardwood timber resource in the West and was presumably based primarily on imported veneer.

Of the other major primary products, about 65 percent of the woodpulp, 49 percent of the particleboard, and nearly all of the naval stores were from the South. For woodpulp and particleboard, these were somewhat larger proportions than in 1963.

## Value of products shipped from primary manufacturing industries \$23 billion in 1972

The total value of products shipped from the primary manufacturing industries in 1972 amounted to \$23.1 billion (table A-11). This was 86 percent larger than the \$12.4 billion shipped in 1963 and 54 percent above 1967. These increases were due to the rise in product prices during the study period and to the growth in the physical volume of product shipments. In terms of constant 1972 dollars, total value of shipments from the primary manufacturing industries increased about 55 percent between 1963 and 1972.<sup>3</sup> cent—reflects increases in product prices.

Unlike value added, value of shipments data for the primary manufacturing industries include double counting because products of one mill or plant may be shipped as raw material to other plants in the same industry or to others classified in the primary manufacturing categories. For example, the value of lumber shipped from a sawmill to a plywood plant may be counted twice, once as a shipment from the sawmill and again as core material in a shipment from the plywood plant.

## Over half of shipments from pulp, paper, and paperboard mills

In 1972, 51 percent of the value of product shipments from primary manufacturing industries originated in pulp, paper, and paperboard mills, 33 percent in sawmills and planing mills, 13 percent in veneer and plywood plants, and 3 percent in such primary manufacturing enterprises as particleboard plants, and cooperage and wood shingle mills (table A-11, fig. 6).

<sup>2</sup> See Appendix B for the SIC firms included in the major industry groups.

<sup>3</sup> The implicit price deflator for net domestic product in manufacturing was used to derive estimates of value of shipments in 1972 dollars.

Figure 6

## Value of Primary Manufacturing Shipments, by Industry, 1963 and 1972

As shown in figure 6, the value of shipments from each of the primary manufacturing industry sectors increased between 1963 and 1972. This was also true in terms of constant dollars, reflecting the increases in physical output discussed earlier. Because product output and prices followed somewhat different trends among the various industries, the proportion of total shipments attributable to each industry in 1972 was somewhat different from that in 1963 and 1967. Over the total study period, value of shipments from all except the pulp, paper and paperboard industry gained in relative proportion. Much of the increase for the industries classified in "all other" between 1967 and 1972 was due to reclassification of the rapidly growing particleboard industry in 1972. (See Appendix B.)

The South, with \$9.4 billion, led all sections of the Nation in value of products shipped from primary manufacturing industries in 1972. This represented some 41 percent of the national total, up from 37 percent in 1963. The West's share of the total also increased between 1963 and 1972, rising to \$7.5 billion, nearly nine-tenths of which was from the Pacific region.

Oregon and Washington led all the other States in value of shipments with a total of almost \$3.0 billion and \$2.0 billion, respectively (table A-12). Georgia and Wisconsin had the highest totals for States outside of the Pacific region and were the only States in the East to exceed \$1.0 billion in total value of shipments from primary manufacturing industries.

The West led all other sections of the Nation in value of shipments from sawmills and planing mills and from veneer and plywood plants in 1972 (table A-11). The South was first in shipments from pulp, paper, and paperboard mills and from those classified in "all other." In 1967 and 1963, the North was the predominant shipper of products from the pulp, paper, and paperboard industry.

The pulp, paper, and paperboard industry was the largest contributor to total value of shipments in both the North and the South in all study years (table A-11). In 1972, about four-fifths of the total value of shipments in the North and more than half in the South was from pulp, paper, and paperboard mills. In the West, sawmills and planing mills were most important.

## Value added in the primary manufacturing industries \$10.1 billion in 1972

Part of the value of shipments from the primary manufacturing industries represents the cost of stumpage, logs, fuels, chemicals, and other intermediate products purchased from other sectors of the economy. When the costs of these products were deducted from the value of shipments, the value added in primary manufacturing amounted to an estimated \$10.1 billion in 1972, up some 51 percent from 1967 and 85 percent above 1963 (tables A-13 and A-14).

As shown in the source notes to table A-13, these estimates of value added are somewhat below those given in the 1972, 1967, and 1963 *Censuses of Manufactures*, because of differences in definition and coverage. Data shown for primary manufacturing industries in Bureau of the Census publications include value added by logging operations when such operations are conducted by employees of the primary industry. For purposes of this study, the estimated value added in these logging operations was excluded from the totals for primary manufacturing. In addition, the value added for sawmills and planing mills in the East, as reported in the *Census of Manufactures*, was adjusted to include the estimated value added in small sawmills not covered by Census estimates. The combination of these two adjustments resulted in an estimated total value added for this study some \$222.6 million below the Census data for 1972.

## Value added attributed to timber \$8.8 billion

The enterprises classified in the primary manufacturing industries based most of their manufacturing operations on timber products. For example, timber products composed about 95 percent of the cost of materials consumed in the sawmill and planing mills industry, and nontimber materials made up about 5 percent. In the veneer and plywood industry and in the pulp, paper, and paperboard industry, timber products accounted for about 87 percent and 85 percent, respectively, of the cost of materials consumed. Less than 70 percent of the cost of materials consumed by plants in the "all other" industry was for timber products.

By using the proportion of the various materials consumed in each of the SIC industries which make up the primary manufacturing industries in this study (see Appendix B) to allocate total value added, the value added attributed to timber was estimated at \$8.8 billion in 1972 (tables A-15 and A-16). This was about 56 percent larger than in 1967 and 83 percent above the comparable value in 1963.

In 1972, about 52 percent of the value added attributed to timber in the primary manufacturing industries originated in the pulp, paper, and paperboard sector (fig. 7). Another 33 percent originated in sawmills and planing mills, 12 percent in veneer and plywood plants, and 3 percent in other primary manufacturing enterprises. This distribution was somewhat different from that in 1963, primarily because of the changes in the relative value of shipments from the various industries, and some change in the volumes of timber products consumed in relation to all products consumed.

About 41 percent of the value added attributed to timber in the primary manufacturing industries in 1972 originated in the South, up from 39 percent in 1963. The percentage originating in the West also increased in the 1963-72 period, rising from 28 percent to 33 percent. Most of the decline in the percentage originating in the North was due to the relatively slower growth of the veneer and plywood industry and the pulp, paper, and paperboard industry in that section of the Nation.

## Value added attributed to timber per unit of timber input highest for pulp, paper, and paperboard mills

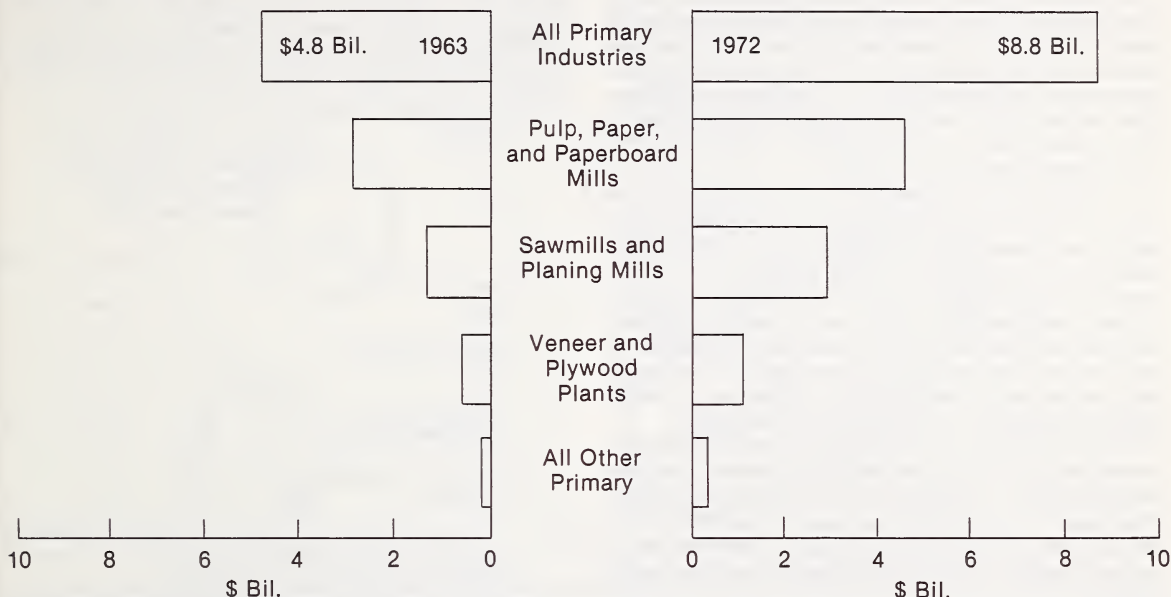

As shown in the following tabulation, the value added attributed to timber per cubic foot of wood consumed in the pulp, paper, and paperboard industry was more than 2.5 times the average for the sawmills and planing mills industry and 64 percent above the average for veneer and plywood plants. The primary reasons for these variations are differences in relative cost of the various materials used in the manufacturing processes, the degree of processing, and the value of products manufactured.

Industry	Value added attributed to timber per cubic foot of wood consumed, 1972 <sup>1</sup> (dollars)
Sawmills and planing mills	0.49
Veneer and plywood	.77
Pulp, paper, and paperboard	1.26

<sup>1</sup> Estimates derived by dividing value added attributed to timber in each industry (table A-15) by the volume of wood harvested by type of timber product (table A-3).

Figure 7

### Value Added Attributed to Timber in Primary Manufacturing, by Industry, 1963 and 1972

### Employment in primary manufacturing industries 487,900 in 1972

In 1972, some 487,900 persons were employed in the primary manufacturing industries (tables A-17 and A-18). This was about 3 percent below the total 502,400 employed in 1963. Although there was some variation, the trend over the entire study period was down for the sawmills and planing mills and slightly up for the veneer and plywood plants and the pulp, paper, and paperboard mills. The industries classified in "all other" showed an increase of about 46 percent between 1963 and 1972; however, this was primarily due to the inclusion of the particleboard industry for the first time in 1972. (See Appendix B.)

The decline in the number of employees in the sawmills and planing mills industry, despite the rise in product output over the study period, was the result of significant increases in productivity. According to data published by the Bureau of Labor Statistics, output per employee hour rose at an average annual rate of 2.8 percent in the sawmills and planing mills industry (SIC 2421) between 1963 and 1972. These gains resulted from substantial technological change in plant design, sawing machinery and methods, and lumber handling equipment. Also im-

portant to the overall increase in industry productivity was the continuing decline in the number of small, relatively less efficient mills, particularly in the East. Although no exact numbers are available, trend estimates indicate that as many as 10,000 of these mills may have gone out of existence during the study period.

There were also significant increases in productivity in the veneer and plywood industry and the pulp, paper, and paperboard industry between 1963 and 1972, resulting in only modest increases in employment despite large rises in industry output. Bureau of Labor Statistics data show that output per employee has increased at average annual rates of 3.9 percent and 4.0 percent, respectively, for the veneer and plywood industry and the pulp and paperboard industry.

As discussed earlier in this report, the estimates of employment shown in table A-17 and A-18 are somewhat below those contained in the 1972, 1967, and 1963 *Censuses of Manufactures* because of differences in coverage and industry definitions. The adjustments to the data from the Census studies for small sawmill and logging employment resulted in an estimated total employment for this study some 19,500 below the Census data for 1972 (see source notes, table A-17).

## Employment attributed to timber in primary manufacturing 426,550 in 1972

As discussed earlier, most of the timber-based enterprises classified in the primary manufacturing industries based part of their manufacturing operations on non-timber materials. Because of this, only a part of the total employment in these industries was attributed to timber. This amounted to the equivalent of 426,550 people in 1972, down from a total of 437,500 in 1967 and 449,750 in 1963 (tables A-19 and A-20).

In 1972, about 43 percent of the employment attributed to timber in primary manufacturing was in pulp, paper, and paperboard mills (fig. 8). An additional 40 percent was in sawmills and planing mills, 14 percent in veneer and plywood plants, and 3 percent in "other" primary manufacturing. This was somewhat different from the distribution in 1963, when about 44 percent of the total was in sawmills and planing mills; 41 percent in pulp, paper, and paperboard mills; 13 percent in veneer and plywood plants; and 3 percent in "all other."

These distributions of employment were in large part determined by the relative volumes of wood processed, the degree of its processing, and trends in these factors. The degree of processing is particularly important in explaining the relatively large volumes of employment in the pulp, paper, and paperboard industry and the veneer

and plywood industry. As shown in the following tabulation, the employment attributed to timber per unit of wood input was much larger in the pulp, paper, and paperboard industry and the veneer and plywood industry than in the sawmills and planing mills industry in both 1963 and 1972. In addition, the increases in productivity discussed earlier can be seen in the decline in the number of employees per unit of wood input.

Industry	Number of employee years attributed to timber per million cubic feet of wood consumed <sup>1</sup>	
	1972	1963
Sawmills and planing mills	29	37
Veneer and plywood plants	42	62
Pulp, paper, and paperboard mills	50	68
All primary manufacturing industries	36	43

<sup>1</sup> Estimates derived by dividing employment attributed to timber in each industry (table A-19) by the volume of wood produced by type of timber product (table A-3).

Figure 8

## Timber-Based Employment in Primary Manufacturing, by Industry, 1972 and 1963

1972

1963

In 1972, about 43 percent of the total employment attributed to timber was in the South, 29 percent in the West (table A-19, fig. 9). In the West and the South, sawmills and planing mills were the leading employer among the primary manufacturing industries. Pulp, paper, and paperboard mills were the largest primary industry employer in the North.

## Average value added per employee different by industry and region

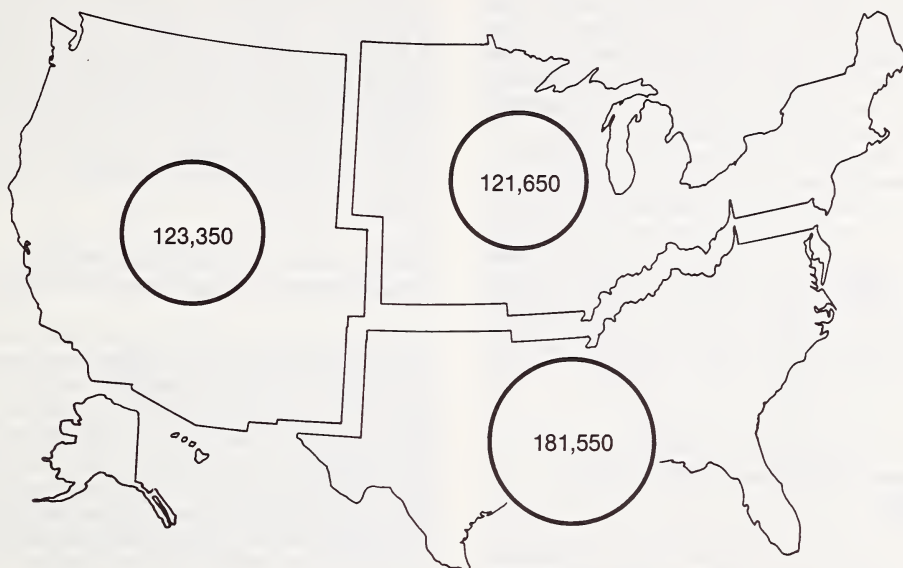

Because of differences in such factors as degree of process automation, scale of operations, capital investment, worker and managerial skills, and differences in wage rates, there is a great deal of variation in average value added per employee among the primary manufacturing industries. In 1972, average value added per employee in the pulp, paper, and paperboard industry was \$24,880—about 51 percent larger than the average \$16,510 in the sawmills and planing mills industry and a third above the \$18,650 average for veneer and plywood plants. There was also considerable regional difference in value added per employee for the various industries. In the sawmills and planing mills industry, for example, the average ranged from a low of \$12,900 in the South to \$22,135 in the West. Value added per employee for both the veneer and plywood industry and the pulp, paper, and paperboard industry was lowest in the North and highest in the West.

Figure 9

**Timber-Based Employment in Primary Manufacturing, 1972**  
**(Total 426,550)**

# Secondary Manufacturing

Many of the products produced by the primary manufacturing industries, such as newsprint, charcoal, and lumber and plywood for do-it-yourself use, are ready for marketing to final consumers. Other primary products, however, such as the dissolving grades of wood pulp, much of the paper and paperboard, and substantial volumes of lumber, veneer and plywood, and particleboard are further manufactured into wearing apparel, containers, furniture, and other consumer goods.

This secondary manufacturing is accomplished in groups of firms that have been classified for this study as the millwork and prefabricated wood products industry; the wooden containers industry; the furniture industry; the paper and paperboard products industry; the fibers, plastics, and textiles industry; and "all other"—a group which includes firms engaged in wood preservation, and in the manufacture of such diverse products as mirror and picture frames, shoe lasts, cork products, ships and boats, toys, and sporting and athletic goods.<sup>4</sup>

## Shipments from selected secondary manufacturing industries in 1972 twice those in 1963

In 1972, the total value of shipments from the millwork and prefabricated wood products, wooden containers, furniture, and paper and paperboard products industries amounted to an estimated \$35.5 billion (tables A-21 and A-22).<sup>5</sup>

About 47 percent of these shipments originated in the paper and paperboard products industry, 28 percent in the furniture industry, 23 percent in the millwork and prefabricated wood products industry, and 2 percent in the wooden containers industry.

Total value of shipments for these selected industries in 1972 was more than double the \$17.4 billion in 1963. Although there were increases in shipments from each of the four industries during the study period, the millwork and prefabricated wood products industry showed the largest rise, more than tripling.<sup>6</sup>

<sup>4</sup> See Appendix B, for the SIC firms included in the major industry groups.

<sup>5</sup> No attempt has been made to show the total value of shipments from all secondary manufacturing industries because of the unknown but considerable amount of duplication resulting from intraindustry and interindustry shipments of products, particularly in the fibers, plastics, and textile products industry.

<sup>6</sup> Some of the differential growth between industries was possibly due to changes in industry definitions during the study period. (See Appendix B).

<sup>7</sup> No attempt was made to compile the total value added by manufacture for industries in the "all other" grouping. Since some timber products are used in most manufacturing industries, such a total would represent a substantial part of all value added in manufacturing. (See Appendix B).

Shipments from the wooden containers industry rose 93 percent, from the furniture industry 9 percent, from the paper and paperboard products industry 78 percent.

Value of shipments was largest in the North in all 3 study years. However, there were important regional shifts between 1963 and 1972. For example, about 52 percent of the total shipments from the four selected industries was in the North in 1972, down from 60 percent in 1963. During the same period, shipments from industries in the South increased from 26 percent to 34 percent of the total. Western shipments were about 14 percent in both years.

## Value added in selected secondary manufacturing industries \$34.0 billion 1972

A substantial part of the value of shipments from the secondary manufacturing industries represented the cost of materials, supplies, containers, fuel, and other supplies and services purchased from other firms and industries. When these costs were deducted from the value of shipments, the value added in the selected secondary manufacturing industries listed above and in the fibers, plastics, and textile industry amounted to \$34.0 billion in 1972, up about 77 percent from the \$19.3 billion estimated for 1963 (tables A-2 and A-24).

In all 3 study years, the fibers, plastics, and textiles industry led the other selected secondary industries in value added; however, its relative proportion declined from about 60 percent in 1963 to 52 percent in 1972. All the other industries showed some percentage increase, except for wooden containers which remained about 1 percent of the total.

## Value added attributed to timber in secondary manufacturing \$12.5 billion industries in 1972

The secondary manufacturing industries based only part of their manufacturing operations on timber products. In some enterprises, such as those manufacturing nailed wood boxes and shook, wood pallets and skids, and wood containers, not classified elsewhere, timber products accounted for as much as 90 percent of the cost of all materials consumed. However, in others, such as those engaged in manufacturing many textile products, timber-based products accounted for as little as 5 percent.

Based largely on the proportionate cost of timber products consumed, the value added attributed to timber in the secondary manufacturing industries listed above and in "all others" using timber products, was estimated at \$12.5 billion in 1972, about 88 percent larger than the \$6.6 billion estimated for 1963 (tables A-25 and A-26, fig. 10). The contributions of the various secondary in-

dustries to the total were somewhat different. In 1972, about 40 percent of the total originated in the paper and paperboard products industry. An additional 21 percent was added in the fibers, plastics, and textiles industry—mostly in firms engaged in throwing, spinning, and weaving rayon and in manufacturing rayon clothing. The millwork and prefabricated wood products industry accounted for another 16 percent, the furniture industry 14 percent, the wooden containers industry 3 percent, and “all other” secondary manufacturing industries about 6 percent. This was somewhat different from the distribution in 1963, when the millwork and prefabricated wood products industry composed only 9 percent of the total, and the fibers, plastics, and textiles industry 27 percent. The remaining industries showed relatively small changes.

Because of differences in the importance of timber products as a raw material in the various industries, the distribution of value added attributed to timber by industry was markedly different from that of total value added. For example, the value added attributed to timber was a relatively small part of the total value added in the fibers, plastics, and textile industry, a somewhat larger part in the furniture industry, and largest for the millwork and prefabricated wood products, wooden containers, and paper and paperboard products industries.

In 1972, about 52 percent of the value added attributed to timber in the secondary manufacturing industries was in the North, 36 percent in the South, and 12 percent in West (table A-26). In 1963, the North accounted for 58 percent, the South 31 percent, and the West 11 percent. These shifts were largely the result of differential regional growth for the various industries. For example, in 1963, the North led in value added attributed to timber in five of the six secondary industries, trailing only the South in the wooden container industry. However, by 1972, the South also led in the furniture, and the fibers, plastics, and textiles industries, and had shown faster growth in the remaining two industry groups.

### Employment in selected secondary manufacturing industries 2.7 million in 1972

Employment in all the secondary manufacturing industries except the “all other” grouping<sup>8</sup> amounted to about 2.7 million in 1972, slightly above employment in 1967 and about 10 percent more than the 2.5 million employed in 1963 (tables A-27 and A-28). Three-fifths of the total in 1972 was in the fibers, plastics, and textile in-

<sup>8</sup> No attempt was made to compile total employment in the “all other” secondary manufacturing grouping. Since some timber products are used in most manufacturing industries, such a total would represent a substantial part of all employment in manufacturing. (See Appendix B).

Figure 10

### Value Added Attributed to Timber in Secondary Manufacturing, by Industry, 1963 and 1972

dustry, and 15 percent each in the furniture industry and in the paper and paperboard products industry.

The South had the greatest number of employees in the selected secondary manufacturing industries in 1972, displacing the North which led in 1963. Among the various industries, the South was the largest employer in the fibers, plastics, and textiles industry, the furniture industry, and the wooden containers industry, while the North continued to lead in the millwork and prefabricated wood products industry and in the paper and paperboard products industry. In 1963, the North was the largest regional employer in all except the wood container industry.

### Employment attributed to timber in secondary manufacturing industries 900,400 in 1972

In 1972, the employment attributed to timber amounted to an estimated 900,400 people (full-time equivalent) in the industries classified in the secondary manufacturing groupings (including employment attributed to timber in "all other") (tables A-29 and A-30). This was almost 50,000 more than in 1967 and up 14 percent from the 789,800 estimated for 1963. As discussed earlier, these estimates of employment attributed to timber were largely based on the relative cost of timber-based raw materials consumed.

About 31 percent of the total employment attributed to timber in 1972 originated in the paper and paperboard products industry (fig. 11). An additional 27 percent was in the fibers, plastics, and textiles industry, 17 percent in the furniture industry, 15 percent in the millwork industry, 4 percent in the wooden containers industry, and 6 percent in "all other" secondary manufacturing industries. These were about the same percentages as in 1963 for the paper and paperboard products, the furniture, and the wooden containers industries. The fibers, plastics, and textiles industry and the "all other" grouping, on the other hand, showed little change in total employment, and thus, a decline in relative proportion. Employment attributed to timber in the millwork and prefabricated wood products industry increased more than 90 percent; however, as discussed earlier, much of this was probably due to the changes in industry composition and classification shown in Appendix B.

As shown in figure 12 and the following tabulation, the North led in total employment attributed to timber in secondary manufacturing industries in all 3 study years. However, because of such factors as differential industry growth, regional shifts, differences in productivity, and changes in timber products use, its relative share dropped steadily. Most of this decline was counterbalanced by increases in the South.

Relative share of total employment attributed to timber in secondary manufacturing industries

Region	1972 (percent)	1967 (percent)	1963 (percent)
North	48	53	55
South	41	37	35
West	11	10	10
All regions	100	100	100

Among the various secondary manufacturing industries, the North showed relatively slower growth than the South and West in employment attributed to timber in the millwork and prefabricated wood products and paper and paperboard products industries and an actual decline for the furniture; fibers, plastics, and textiles; and "all other" industries.

### Average value added per employee highest in the paper and paperboard products industry

The average value added per employee varied considerably among the secondary manufacturing industries. For example, in 1972, the average in the paper and paper-

Figure 11

### Timber-Based Employment in Secondary Manufacturing, by Industry, 1972 and 1963

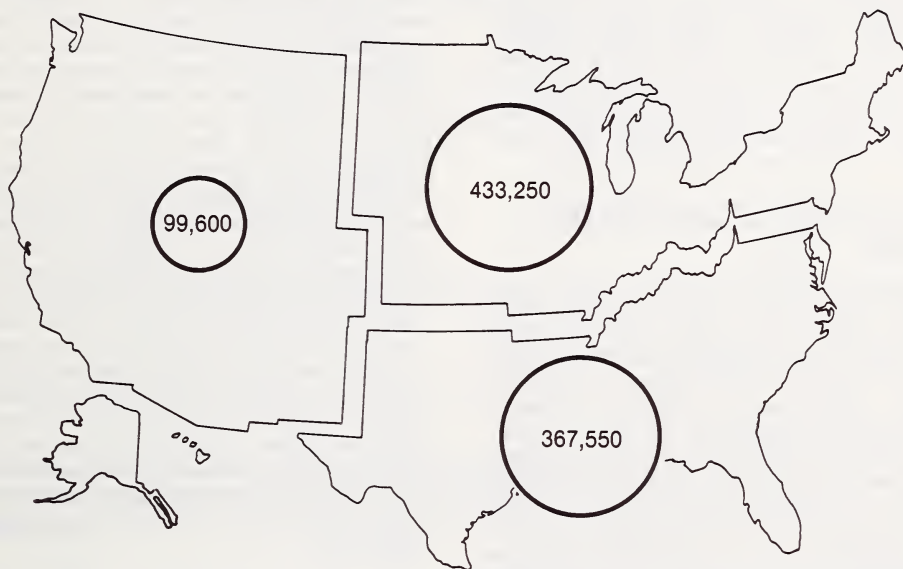

board products industry was about \$18,420—almost double the average \$9,725 in the wooden containers industry. There was also a substantial range in averages between regions within the same industry. Most of these varia-

tions are due to such factors as regional and industry differences in worker and managerial skills, wage rates, process automation, capital investment, and scale of operations.

Figure 12

---

**Timber-Based Employment in Secondary Manufacturing, 1972**  
**(Total 900,400)**

# Construction

Construction is the most important final use for timber products. Recent studies have shown that in the 1960's and early 1970's as much as three-fourths of the softwood lumber and plywood; a tenth of the pulp products; all of the poles, piling, and shingles; and significant quantities of other timber products consumed in the United States, were used in construction.

Construction, as defined for this study, includes the erection, maintenance, and repair of immobile structures and utilities, together with their integral service facilities. Structures include buildings, docks, bridges, railways, and other similar works that are built into or affixed to the land. Utilities are such things as electric light and power transmission lines, telephone and telegraph lines, sewers, and other similar facilities generally used for supplying services to individuals and establishments.

## Value of construction an estimated \$159 billion in 1972

Construction grew rapidly during the study period. The estimated total value of new construction and maintenance and repair construction was about \$159.1 billion in 1972, up from \$85.3 billion in 1963. The largest single construction component in terms of value was residential construction. In 1972, for example, nearly 44 percent of the total value of new construction put in place was attributable to private residential building (table A-31). Housing is also the most important construction sector in terms of wood products use. An estimated 41 percent of all of the softwood sawtimber products consumed in the United States in 1972 was used for new housing units. More than 95 percent of this was consumed in the 2.4 million housing units constructed on-site (table A-32).<sup>9</sup>

A substantial part of the expenditures for construction, and of the value of a firm's production, represents payments for construction work subcontracted to other firms and payments for materials, components, and supplies purchased from other sectors of the economy. When estimates of these costs (and receipts for land development for certain firms) were taken into consideration, the value added in construction amounted to an estimated \$79.6 billion in 1972, 59 percent above 1967 and 93 percent larger than the \$41.1 billion estimated for 1963 (table A-33).

<sup>9</sup> Mobile homes are a product of industry SIC 2451 and for purposes of this study were classified in secondary manufacturing in the millwork and prefabricated wood products industry. (See appendix B).

<sup>10</sup> As in the table A-34, these are estimates of total construction employment and thus considerably exceed those in Contract Construction (SIC's 15, 16, and 17) alone, as shown in the *Censuses of Construction Industries*.

## Value added attributed to timber in construction \$11.9 billion in 1972

The volume of construction and, consequently, the value added in construction, vary substantially between the sections and regions of the Nation. In addition, there are marked differences in the types of buildings and other structures constructed and in the volumes and kinds of materials used to build them. For example, studies have shown that the cost of lumber and other wood products as a percent of the total cost of materials, supplies, and equipment may vary from 41 percent for single-family housing to 22 percent for multifamily housing to as little as 0.8 percent for sewer line construction. Moreover, because of such factors as size, style, consumer preferences, and regional materials availability and cost, the kinds of materials used in a given type of construction may be quite different in different areas. By assuming that value added could be allocated in proportion to the cost of the various materials used, the value added attributed to timber was estimated at \$11.9 billion in 1972, \$6.7 billion in 1967, and \$6.2 billion in 1963 (table A-33).

In 1972, about 46 percent of the value added attributed to timber was in the North, 32 percent in the South, and 22 percent in the West (fig. 13). This represented a rather large gain since 1963 for the South at the expense of the other two regions. California was the leading State, accounting for 11 percent of total value added attributed to timber nationwide and over half of that in the West. New York, Florida, Texas, and Illinois ranked next in order of importance.

## Construction employment 5.3 million in 1972—795,250 attributed to timber

In 1972, the equivalent of about 5.3 million employees was engaged in construction activities (table A-34), an increase of about 21 percent from the 4.4 million employed in 1963.<sup>10</sup> Using the proportionate cost of timber products by building type, year, and region as discussed earlier and in table A-34, the employment attributed to timber rose from 647,150 in 1963 to 795,250 in 1972.

In 1972, about 42 percent of total employment attributed to timber was in the North, 39 percent in the South, and 19 percent in the West (fig. 14). As was true for value added, this represented a proportionate gain for the South, and losses for the North and West. California was the leading State for construction employment attributed to timber; Florida, Texas, and New York followed in order.

Figure 13

**Value Added Attributed to Timber in Construction, by Region, 1963 and 1972**

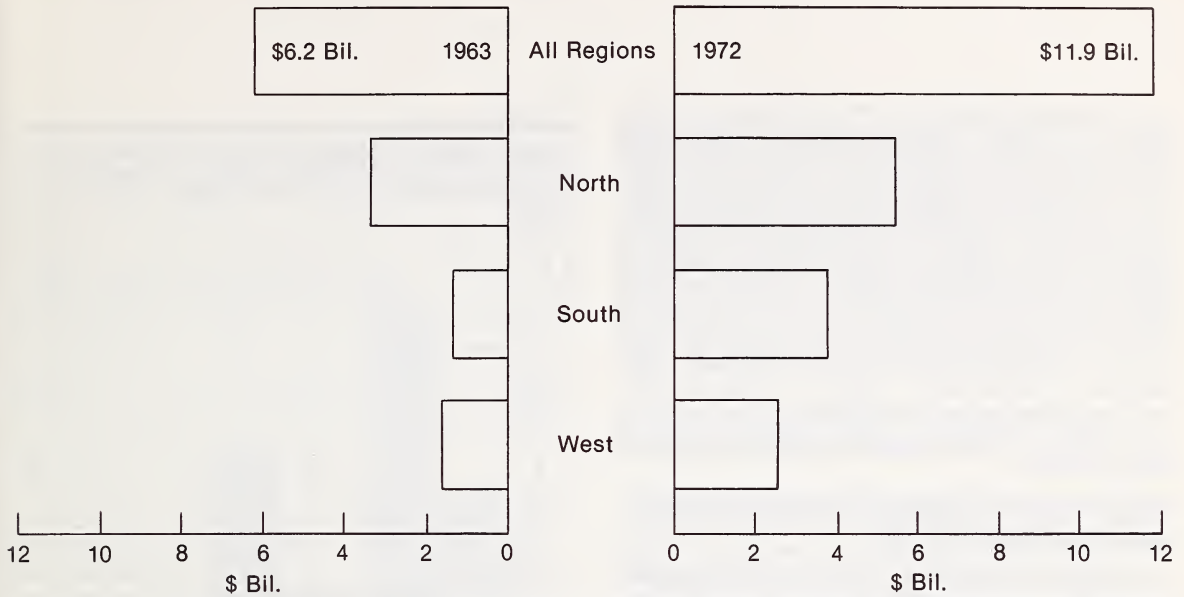

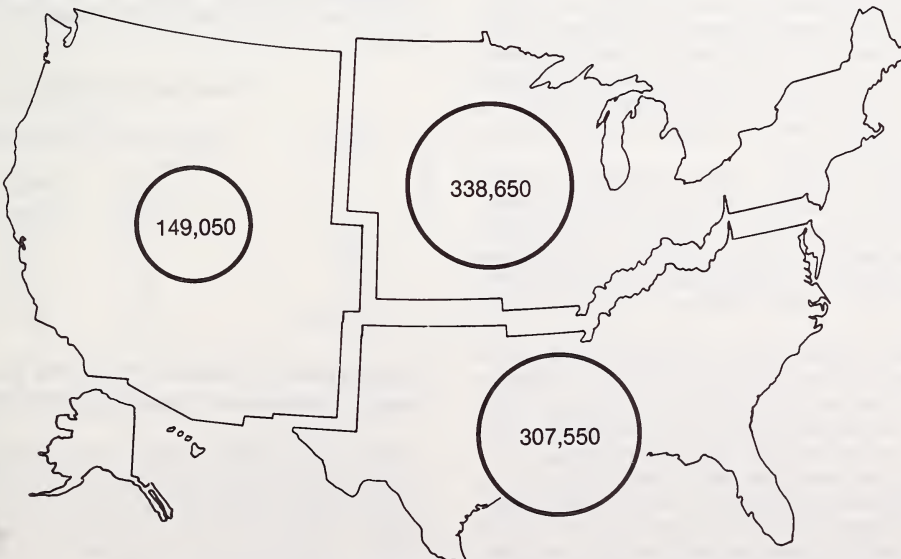

Figure 14

**Timber-Based Employment in Construction, 1972  
(Total 795,250)**

# Transportation and Marketing

The activities discussed in the earlier sections of this report have been concerned with producing and harvesting timber products and converting these products into finished goods. There are also other kinds of activities involved in preparing timber and related products for use by final consumers. These include transporting logs and other timber products from local points of delivery to manufacturing plants or consumers; transporting primary and secondary products from points of manufacture to final consumers; and marketing these products through wholesale and retail channels. These activities are carried on in a group of enterprises that have been classified as the railroad, truck, and water transportation industries, and the wholesale and retail trade industries.

## Value added in transportation and marketing about \$194 billion in 1972

The total value added in transportation and marketing amounted to an estimated \$194 billion in 1972, up from \$127 billion in 1967 and \$97 billion in 1963. In all 3 years, more than four-fifths of the total originated in marketing, largely in the retail trade sectors (table A-35).

## Value added attributed to timber in transportation and marketing, \$9.3 billion in 1972

Only a relatively small part of the activity of enterprises in transportation and marketing was based on timber products. In the transportation industries in 1972, these products accounted for about 13.5 percent in railroad transportation, 10.3 percent in water transportation, and 5.7 percent in truck transportation. In wholesale trade and retail trade, sales of timber products accounted for slightly over and slightly under 4 percent, respectively, of total sales.

By assuming that value added attributed to timber products could be estimated from their relative proportion of total freight revenues or wholesale or retail sales, the total value added attributed to timber in transportation and marketing was estimated at \$9.3 billion in 1972, \$6.4 billion in 1967, and \$5.5 billion in 1963 (table A-35, fig. 15).

The industry origins of the value added attributed to timber are shown in tables A-36 and A-37. In 1972, about 71 percent of the total was added in marketing—mostly in retailing. The remaining 29 percent was in transportation, largely in railroad and truck transportation.

As shown in the tabulation below, about 50 percent of the total value added attributed to timber in transportation and marketing in 1972 was in the North, 30 percent in the South, and 20 percent in the West. This was somewhat different from the distribution in 1963, when about

Figure 15

## Value Added Attributed to Timber in Transportation and Marketing, 1963 and 1972

\$ Bil.

56 percent was in the North and 24 percent in the South. The Western proportion did not change during the study period.

Region	Value added attributed to timber in transportation and marketing	
	1972 percent	1963 percent
North	50	56
South	30	24
West	20	20
All regions	100	100

## Employment attributed to timber in transportation and marketing 835,150 in 1972

About 18.7 million people were employed in transportation and marketing in 1972 (table A-38). This was some 13 percent above 1967 and 24 percent larger than the 15.0 million employed in 1963. In all 3 years, nearly nine-tenths of the total was in marketing—largely in retail trade (tables A-39 and A-40).

By assuming that timber-based employment in transportation and marketing could be estimated from the proportion of freight revenue from or sales of the various timber products, the employment attributed to timber was calculated to total the equivalent of 835,150 employees in 1972, about the same as in 1967 and up some 4.3 percent from 800,400 in 1963.

Marketing accounted for four-fifths of the total combined employment attributed to timber in transportation and marketing in 1972. In all, 669,700 people were employed in timber-based marketing activities in 1972, up 10 percent from the 610,200 employed in 1963 (table A-40). Although there was some fluctuation, employment attributed to timber increased in both retail and wholesale trade during the study period.

Employment attributed to timber in transportation, on the other hand, declined between 1963 and 1972, dropping 13 percent to 165,450 (table A-39). Truck transportation registered an increase; however, both railroad and water transportation employment dropped sharply.

Because of a number of factors that include population patterns, industry locations, and resource availability, the employment attributed to timber in transportation and marketing varied somewhat between the major sections of the Nation. In 1972, for example, about 49 percent of the total was in the North, 32 percent in the

South, and 19 percent in the West (fig. 16). This represented a substantial proportionate gain for the South and decline for the North during the study period. The percentage in the West showed a small rise.

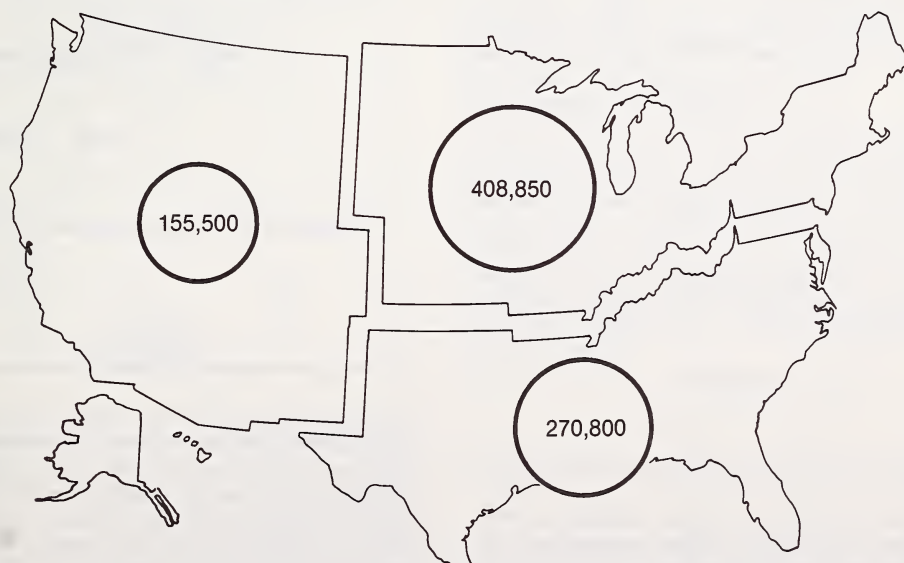

In 1972, the employment attributed to timber in transportation and marketing made up about 4.5 percent of the total employment in these combined industries, down from 5.3 percent in 1963. This decline resulted from drops in the percentages both for wholesale and retail trade and for truck and water transportation.

### **Average value added per employee highest in railroad transportation, lowest in retail trade**

In 1972, average value added per employee in transportation and marketing ranged from a high of about \$18,010 in railroad transportation to a low of \$7,330 in retail trade. There was also a substantial range in the average value added per employee among the regions of the country within the same industry. As discussed for other industries, most of the variation is due to such factors as regional and industry differences in worker and manager skills, wage rate, capital investment, and scale of operations.

Figure 16

### **Timber-Based Employment in Transportation and Marketing, 1972 (Total 835,150)**

## Conclusion

In the preceding sections of this report, estimates of value added and employment attributed to timber in the major timber-based economic activities have been presented. In this section and in table 1 shown on page 5, these estimates are combined and estimates of total gross national product and employment originating in all timber-based economic activities are presented.

### About 4.1 percent of the Nation's GNP from timber-based economic activities

The sum of the values added attributed to timber in all kinds of timber-based economic activities amounted to about \$48.5 billion in 1972 (tables A-41 and A-42). This represented about 4.1 percent of the Nation's GNP (fig. 17). This means that about \$1 out of every \$24 of the GNP originated in some type of timber-based economic activity. In 1963, the sum of the values added attributed to timber totaled \$26.1 billion and composed 4.4 percent of the GNP.

Figure 17

### Gross National Product Originating in Timber-Based Activities, 1972 and 1963

1972

1963

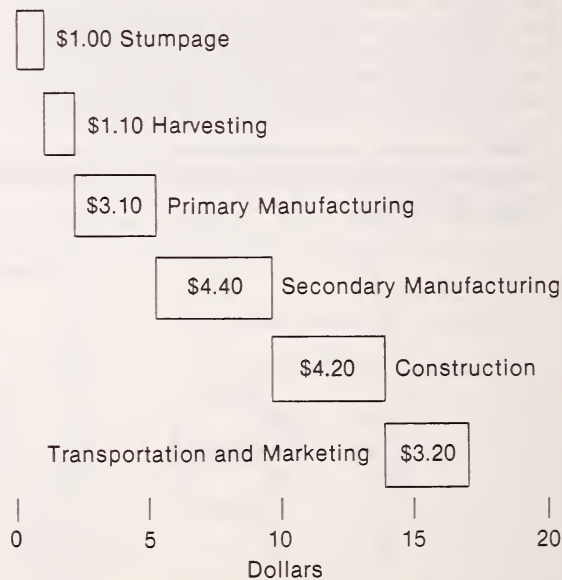

Of the total value added attributed to timber in 1972, about 6 percent was added in timber management. Another 6 percent was added in harvesting, 18 percent in primary manufacturing, 26 percent in secondary manu-

facturing, 25 percent in construction, and 19 percent in transportation and marketing. The distribution of total value added attributed to timber was about the same in 1963 and 1967.

Looked at in another way, the data on value added show that in 1972, timber increased in value nearly 17 times between the stump and delivery of finished timber-based products to final consumers (fig. 18). On the average, to each \$1 worth of stumpage cut, another \$1.10 was added in harvesting, \$3.10 in primary manufacturing, \$4.40 in secondary manufacturing, \$4.20 in construction, and \$3.20 in transportation and marketing. In 1967, the total increase was almost \$21 and in 1963 about \$19.50.

Figure 18

### Timber-Based Value Added per Dollar of Stumpage Cut, by Activity, 1972

Geographically, about 40 percent of the value added attributed to timber in 1972 was in the North, 35 percent in the South and 25 percent in the West. California, in the West, led all the States in total value added; followed by New York in the North; and Oregon and Washington, also in the West (table 42). Pennsylvania was second to New York in the North. Texas, North Carolina, and Georgia had the highest totals for the southern States.

Among the various activities, value added in timber management and harvesting was highest in the West; in primary manufacturing in the South; and in secondary manufacturing, construction, and transportation and marketing in the North.

### One of every 25 workers employed in timber-based economic activity

Employment (full-time equivalent) in all timber-based economic activities amounted to 3.3 million people in 1972 (tables A-43 and A-44). This represented about 4.0 percent of the total civilian employment in the United States in 1972 and means that about 1 out of every 25 people employed was engaged in some kind of timber-based economic activity (fig. 19). In 1963, the employment attributed to timber was 3.1 million, about 4.5 percent of total civilian employment.

Figure 19

### Employment Originating in Timber-Based Activities, 1972 and 1963

Some 4 percent of the employment attributed to timber was in timber management (fig. 20). An additional 6 percent was in harvesting, 13 percent in primary manufacturing, 27 percent in secondary manufacturing, 24 percent in construction, and 26 percent in transportation and

Figure 20

### Timber-Based Employment, by Activity, 1972

marketing. These data on employment attributed to timber show that for each worker employed in management and harvesting, four were employed in primary and secondary manufacturing and five in construction, transportation, and marketing.

In 1972, 42 percent of the total employment attributed to timber was in the North, 39 percent in the South, and 19 percent in the West. California had the largest State timber-based employment followed by New York, Pennsylvania, Texas, and North Carolina. The South led all other sections of the Nation in employment in timber management, harvesting, and primary manufacturing, while the North had the highest number employed in secondary manufacturing, construction and transportation and trade.

<sup>1</sup> Less than 500 employees.

Note: Estimates of the number of temporary employees and forest landowners engaged in timber management activities have been converted to a full-time basis. No direct data are available on the number of professional foresters employed; however, information from the *Journal of Forestry*, the *Economic Importance of Timber in the United States* and other sources indicate that about 20,000 of the total 117,200 persons employed in 1972 were professional foresters.

Sources: Estimates of the full-time equivalent of the number of employees engaged in timber management activities were derived from data published in the U.S. Department of Commerce, Bureau of the Census, 1960 and 1970 *Censuses of Population*, the *Journal of Forestry*, the *Economic Importance of Timber in the United States* and from data in personnel and administrative records of the Bureau of Land Management, U.S. Department of the Interior, and the Forest Service, U.S. Department of Agriculture.

#### Footnotes for Table A-1.

<sup>1</sup> Timber products cut from roundwood.

<sup>2</sup> Less than 500 thousand dollars.

<sup>3</sup> Less than 500 thousand cubic feet.

Source: *Volume*—Estimates based on data published by the U.S. Department of Commerce, Bureau of Census in the 1963, 1967, and 1972 *Censuses of Manufacturers*, annual issues of Bureau of the Census Current Industrial Reports Series for timber products, and data collected by the Forest Service as part of surveys of timber products output by State. *Value*—Estimates derived from the calculated volumes and estimates stumpage prices based on prices received for National Forest timber, data contained in various State reports on forest product prices, and price data collected by the Forest Service. Value added and value added attributed to timber are assumed to equal value of stumpage cut.

Table A-3.—Estimated volume of round timber products harvested in the United States, by major product, region, and State, 1972, 1967, and 1963.

(Thousand cubic feet)

<sup>1</sup> Value at local points of delivery.

<sup>2</sup> Includes products such as poles and piling, fence posts, mine timbers, cooperage logs, logs and bolts used for shingles, excelsior, and a wide assortment of other wood items: Christmas trees, maple sap; and pine gum.

<sup>3</sup> Less than 500 thousand dollars.

Sources: Estimates based on the volumes shown in Table A-3 and estimated delivered values contained in various State reports on forest product prices and price data collected by the Forest Service.

Total, United States	276,550	106,700	18,450	72,100	79,300

<sup>1</sup> Includes products such as poles and piling, fence posts, mine timbers, cooperage logs, and logs and bolts used for shingles, excelsior and a wide assortment of other wood items; Christmas trees; maple sap; and pine gum.

<sup>2</sup> Less than 500 employees.

Sources: Estimates of employment in harvesting were calculated from product output data shown in table A-3 and factors derived from those in *The Economic Importance of Timber in the United States*, logging employment data from the 1960 and 1970 *Censuses of Population*, national and regional timber products output data from various Forest Service reports, and productivity estimates from the Bureau of Labor Statistics, U.S. Department of Labor.

#### Footnotes for Table A-5.

<sup>1</sup> Value at local points of delivery.

<sup>2</sup> Less than 500 thousand dollars.

Sources: *Value*—See source notes, table A-4. *Value added and value added attributed to timber*—based on the estimated number of employees in harvesting (see table A-7) and estimates of average value added per employee. Estimates of average value added per employee based on employment and value added in the "logging camps and contractors" industry (SIC 2411) published in the 1963, 1967, and 1972 *Censuses of Manufactures*. All of the value added was attributed to timber because all final products in this industry consisted of timber and related products.

Note: Industry composition and definitions are given in Appendix B.

Sources: See table A-11.

**Footnote for Table A-11.**

<sup>1</sup> Includes enterprises manufacturing particleboard, excelsior, wood shingles, cooperage, and gum and wood naval stores.

Note: Industry composition and definitions are given in Appendix B.

Sources: *Value of shipments*: U.S. Department of Commerce, Bureau of the Census. 1963, 1967, and 1972 *Censuses of Manufactures*. The sawmills and planing mills industry value of shipments were adjusted to include shipments from small eastern mills not included in the Census estimates. The value of shipments from sawmills and planing mills as reported by Census and the estimates made for this study are shown below. Estimates of value of shipments for States and regions for which no Census information was published were derived from table footnotes and trend data.

Less than 500 thousand dollars.

Note: Industry composition and definition are given in Appendix B.

Sources: See table A-13.

## Footnotes for Table A-13.

† Includes enterprises manufacturing particleboard, excelsior, wood shingles, cooperage, and gum and wood naval stores.

Note: Industry composition and definitions are given in Appendix B.

Sources: Value added: U.S. Department of Commerce, Bureau of Census, 1963, 1967, and 1972 *Censuses of Manufactures*. The sawmills and planing mills industry values added were adjusted to include the value added in small eastern mills not covered by Census estimates, and to exclude the value added in logging and woods operations conducted in combination with sawmills. The veneer and plywood and pulp, paper, and paperboard industries values added were also adjusted to exclude the value reported by Census and the comparable estimates made for this study are shown below. Estimates of values added for States and regions for which no Census information was published were derived from table footnotes and industry trend data.

<sup>1</sup> Includes manufacturers of particleboard, excelsior, wood shingles, cooperage, and wood and gum naval stores.

Note: Industry composition and definitions are given in Appendix B.

Sources: Estimates of value added attributed to timber are based on value added by industry (table A-13) and ratios between the cost of timber products consumed and the cost of all materials consumed by industry, published by the U.S. Department of Commerce, Bureau of the Census in the 1963, 1967, and 1972 *Censuses of Manufactures*. Changes in the industry ratios during the study period are due to changes in industry composition (see Appendix B) as well as changes in the consumption ratios.

Note: Industry composition and definitions are given in Appendix B.

Sources: See table A-17.

## Footnotes for Table A-17.

<sup>1</sup> Includes enterprises manufacturing particleboard, excelsior, wood shingles, cooperage, and gum and wood naval stores.<sup>2</sup> Less than 500 employees.

Note: Industry composition and definitions are given in Appendix B.

Source: *Employment*: U.S. Department of Commerce, Bureau of the Census 1963, 1967, and 1972 *Censuses of Manufactures*. The sawmills and planing mills industry employment data were adjusted to include estimates of employment in logging and woods operations conducted in combination with those industries. The employment reported by Census and the comparable estimates made for this study are shown below. Estimates of employment for States and regions for which no Census information was published were derived from table footnotes and industry trend data.

<sup>1</sup> Includes enterprises manufacturing particleboard, excelsior, wood shingles, cooperage, and gum and wood naval stores.

<sup>2</sup> Less than 500 employees.

Note: Industry composition and definitions are given in Appendix B.

Sources: Estimates of employment attributed to timber are based on employment by industry (table 17) and ratios between the cost of timber products consumed and the cost of all materials consumed by industry, published by the U.S. Department of Commerce, Bureau of the Census in the 1963, 1967, and 1972 *Censuses of Manufactures*. Changes in the industry ratios during the study period are due to changes in industry composition (see Appendix B) as well as changes in the consumption ratios.

Note: Industry composition and definitions are given in Appendix B.

Sources: Estimates of value added attributed to timber are based on value added by industry, and for most industries, the ratio between the cost of timber products consumed and the cost of all materials consumed. For those industries (generally in the Fibers, plastics, and textiles group) for which materials consumption was not available, ratios were estimated from the values of quantities of final goods produced. All data from the U.S. Department of Commerce, Bureau of the Census, 1963, 1967, and 1972 *Censuses of Manufactures*. For the "all other" grouping estimates derived from the volume of timber products consumed from data in U.S. Department of Agriculture, Forest Service, 1960 and 1965 reports of wood used in manufacturing industries.

<sup>1</sup> Less than 500 employees.

Note: Industry composition and definitions are given in Appendix B.

Source: Estimates of employment attributed to timber are based on employment by industry, and for most industries, the ratio between the cost of timber products consumed and the cost of all materials consumed. For those industries (generally in the fibers, plastics, and textile group) for which materials consumption was not available, ratios were estimated from the values or quantities of final good produced. All data from the U.S. Department of Commerce, Bureau of the Census, 1963, 1967, and 1972 *Censuses of Manufactures*. For the "all other" grouping, estimates derived from the volume of timber products consumed data in U.S. Department of Agriculture, Forest Service, 1960 and 1965 reports on wood used in manufacturing industries.

**Footnotes for Table A-39, page 71.**

<sup>1</sup> Less than 500 employees.

Sources: *Railroad*—Estimates of State and regional employment in railroad freight operations were derived by (1) distributing total U.S. employment in railroad transportation from the 1972, 1967, and 1963 editions of *Employment and Earnings*, published by the U.S. Department of Labor, Bureau of Labor Statistics, using the State and regional distribution of the average number of employees covered by the Railroad Retirement and Railroad Unemployment Insurance Acts and (2) adjusting these estimates by the proportion of total railroad revenues due to freight operations (95.9 percent in 1972, 91.5 percent in 1967, and 88.4 percent in 1963). These ratios were calculated, by region, from data in the 1972, 1967, and 1963 editions of *Transport Statistics in the United States* published by the U.S. Interstate Commerce Commission. Estimates of value added attributed to timber were derived by adjusting the value added in railroad freight operations by the proportion of total freight revenues that were derived from timber products (13.5 percent in 1972, 12.2 percent in 1967, and 13.8 percent in 1963). These ratios were calculated from data on freight revenues by commodity class and region published by the U.S. Interstate Commerce Commission, Bureau of Accounts in the 1972, 1967, and 1963 editions of *Freight Commodity Statistics*.

*Truck*—Estimates of total employment in truck freight transportation and warehousing by State and region were derived from data on total U.S. employment, and State and regional employment covered by State Unemployment Insurance Laws and Unemployment Compensation for Federal Employees programs, published in the U.S. Department of Labor, Bureau of Labor Statistics publications *Employment and Earnings* and *Employment and Wages*. Estimates of employment attributed to timber were derived by adjusting the total estimated employment in trucking and warehousing by the proportion of total freight revenues that were derived from timber products (5.7 percent in 1972, 5.6 percent in 1967, and 7.2 percent in 1963). These ratios were calculated from data on freight revenues by commodity class and region published by the U.S. Interstate Commerce Commission, Bureau of Accounts in the 1972, 1967, and 1963 editions of *Freight Commodity Statistics*.

*Water*—Estimates of total employment in water freight transportation by State and region were derived from data on total U.S. employment, and State and regional employment covered by State Employment Insurance Laws and Unemployment Compensation for Federal Employees programs, published in the U.S. Department of Labor Statistics publications *Employment and Earnings* and *Employment and Wages*. Estimates of employment attributed to timber were derived by adjusting the total estimated employment in water transportation by the proportion of total freight revenues that were derived from timber products (10.3 percent in 1972, 11.3 percent in 1967, and 17.1 percent in 1963). These ratios were calculated from data on water freight revenues by commodity class (and region for 1963) published by the U.S. Interstate Commerce Commission, Bureau of Accounts in 1972, 1967, and 1963 editions of *Freight Commodity Statistics*.

## Footnotes for Table A-36, page 67.

<sup>1</sup> Less than \$500,000.

Sources: *Railroad*—Estimates of total U.S. value added in railroad freight operations were derived by adjusting total value added in railroad transportation from the 1972, 1967, and 1963 editions of the *Input-output Structure of the U.S. Economy* published by the U.S. Department of Commerce, Bureau of Economic Analysis, by the proportion of total railroad revenues due to freight operations (95.9 percent in 1972, 91.5 percent in 1967, and 88.4 percent in 1963). These ratios were calculated, by region, from data in the 1972, 1967, and 1963 editions of *Transport Statistics in the United States* published by the U.S. Interstate Commerce Commission, Bureau of Accounts. The State and regional distribution of value added due to freight operations was based on unpublished data from the U.S. Department of Commerce, Bureau of Economic Analysis showing income in railroad transportation by place of work. Estimates of value added attributed to timber were derived by adjusting the total value added in railroad freight operations by the proportion of total freight revenues that were derived from timber product (13.5 percent in 1972, 12.1 percent in 1967, and 13.8 percent in 1963). These ratios were calculated from data on freight revenues by commodity class and region published by the U.S. Interstate Commerce Commission, Bureau of Accounts in the 1972, 1967, and 1963 editions of *Freight Commodity Statistics*.

*Truck*—Estimates of total U.S. value added in truck freight transportation and warehousing were derived from the 1972, 1967, and 1963 editions of the *Input-output Structure of the U.S. Economy* published by the U.S. Department of Commerce, Bureau of Economic Analysis. State and regional estimates of value added were based on unpublished data from the U.S. Department of Commerce, Bureau of Economic Analysis showing income in trucking and warehousing by place of work. Estimates of value added attributed to timber were derived by adjusting the total value added in trucking and warehousing by the proportion of total freight revenues that were derived from timber products (5.7 percent in 1972, 5.6 percent in 1967, and 7.2 percent in 1963). These ratios were calculated from data on freight revenues by commodity class and region published by the U.S. Interstate Commerce Commission, Bureau of Accounts in the 1972, 1967, and 1963 editions of *Freight Commodity Statistics*.

*Water*—Estimates of total U.S. value added in water freight transportation were derived from the 1972, 1967, and 1963 editions of the *Input-output Structure of the U.S. Economy* published by the U.S. Department of Commerce, Bureau of Economic Analysis. State and regional estimates of value added were based on unpublished data from the U.S. Department of Commerce, Bureau of Economic Analysis showing income in water transportation by place of work. Estimates of value added attributed to timber were derived by adjusting the value added in water transportation by the proportion of total domestic freight revenues for inland, coastal, and maritime carriers by water that were derived from timber products (10.3 percent in 1972, 11.3 percent in 1967, and 17.1 percent in 1963). These ratios were calculated from data on water freight revenues by commodity class (and region for 1963) published by the U.S. Interstate Commerce Commission, Bureau of Accounts in the 1972, 1967, and 1963 editions of *Freight Commodity Statistics*.

## Sources for Table A-37, page 68.

Sources: *Retail trade*—Estimates of total U.S. value added were derived from unpublished data on gross product originating in retail trade from the U.S. Department of Commerce, Bureau of Economic Analysis, and various issues of the *Survey of Current Business* published by the U.S. Department of Commerce, containing the "National income and product accounts of the United States." Estimates for States and regions were derived by distributing total value added according to total employee compensation in retail trade from payroll data in the 1972, 1967, and 1963 *Censuses of Retail Trade*. Estimates of value added attributed to timber were calculated by adjusting total value added in retail trade by the estimated proportion of sales that were derived from timber products. These ratios were calculated, by State, from data on sales by merchandise line from the 1972, 1967, and 1963 *Censuses of Retail Trade*.

*Wholesale trade*—Estimates of total U.S. value added were derived from unpublished data on gross product originating in wholesale trade from the U.S. Department of Commerce, Bureau of Economic Analysis, and various issues of the *Survey of Current Business* published by the U.S. Department of Commerce, containing the "National income and product accounts of the United States." Estimates for States and regions were derived by distributing total value added according to total employee compensation in wholesale trade from payroll data in the 1972, 1967, and 1963 *Censuses of Wholesale Trade*. Estimates of value added attributed to timber were derived by adjusting total value added by the estimated proportion of total sales that were derived from timber products. These ratios were calculated from data on sales by commodity class and region from the *Censuses of Wholesale Trade*. Separate estimates were made for merchant wholesalers, and merchandise agents and brokers, and manufacturer's sales branches and sales offices, and incorporated in the final ratios for all wholesale trade.

Table A-33.—Estimated value added and value added attributed to timber in construction in the United States, by region and State, 1972, 1967, and 1963

(Thousand dollars)

Note: The data shown in this table are estimates of total value added in construction including value added for establishments classified in the construction industries (SIC's 15, 16, and 18) and those engaged in construction activity performed by the labor force of nonconstruction establishment for itself or by other entities such as Federal, State, or local governments, or individual property owners for themselves. Value added in both new and maintenance and repair construction is included.

Sources: Estimates of construction industry value added for 1972 and 1967 (\$72.4 billion and \$45.0 billion, respectively), by State and region, were derived from data in the U.S. Department of Commerce, Bureau of the Census, 1972 and 1967 *Censuses of construction industries*. Estimates of construction industry value added for 1963 (\$33.7 billion) were based on the value added by State calculated for 1967 modified by the ratio of State income from contract construction in 1963 to State income from contract construction in 1967. These data were derived from unpublished tabulations of the U.S. Department of Commerce, Bureau of Economic Analysis. Estimates of nonconstruction industry value added (\$7.2 billion in 1972, \$5.0 billion in 1967, and \$7.4 billion in 1963) were based on data in *Economics of the construction industry* published by the Conference Board, and distributed by State according to construction industry value added. Estimates of value added attributed to timber in construction for 1972 and 1967 were calculated from total construction value added by State and the ratios of timber products construction materials cost by type of construction and State. These ratios were derived from data contained in reports on labor and materials requirements in various types of construction published by the U.S. Department of Labor Bureau of Labor Statistics, and the volume of construction by type contained in the 1972 and 1967 *Censuses of construction industries*. Estimates of value added attributed to timber for 1963 were based on the 1967 State ratios modified to account for trends in timber products used by type of construction and total value added by State.

\* Less than 500 employees.

Note: The data shown in this table are estimates of total construction employment, including employees of establishments classified in the construction industries (SIC's 15, 16, and 18) and those engaged in construction activity performed by the labor force of a nonconstruction establishment for itself, or local governments, or individual property owners for themselves. Employment in both new and maintenance and repair construction is included.

Sources: Estimates of construction industry employment for 1972 and 1967 (\$4.8 million, respectively), by State and region, were derived from data in the U.S. Department of Commerce, Bureau of Labor Statistics, 1972 and 1967 *Censuses of construction industries*. Estimates of construction industry employment for 1963 (\$3.6 million) were based on the number of employees in contract construction shown in the U.S. Department of Labor, Bureau of Labor Statistics publication *Employment and earnings*, modified by the ratio of contract to noncontract construction employment in the 1967 *Census of construction industries*. Estimates of nonconstruction industry employment (475,000 in 1972, 450,000 in 1967, and 780,000 in 1963) were based on data in *Economics of the construction industry* published by the Conference Board. Estimates of employment attributed to timber in construction for 1972 and 1967 were calculated from total construction employment by State and the ratios of timber products construction materials cost to all construction materials cost by type of construction and State. The ratios were derived from data contained in reports on labor and materials requirements in various types of construction published by the U.S. Department of Labor, Bureau of Labor Statistics, and the volume of construction by type contained in the 1972 *Censuses of construction industries*. Estimates of employment attributed to timber for 1963 were based on the State ratios for 1967 *Censuses of construction industries*. Estimates of employment attributed to timber for 1963 were based on the State ratios for 1967 attributed to account for trends in timber products use by type of construction and total employment by State.

Sources: *Retail trade*—Includes the total number of paid employees in the work week ending nearest November 15, and the number of active proprietors of unincorporated businesses. Estimates of the number of paid employees for 1972, 1967, and 1963, and active proprietors of unincorporated businesses for 1967 and 1963 were derived from data in the 1972, 1967 and 1963 *Censuses of Retail Trade*. Estimates of the number of proprietors of unincorporated businesses in 1972 were derived from the number of sole proprietorships and partnerships by State in the same source. Estimates of employment attributed to timber were calculated by adjusting total employment in retail trade by the estimated proportion of sales that were derived from timber products. These ratios were calculated, by State, from data on sales by merchandise line from the 1972, 1967, and 1963 *Censuses of Retail Trade*.

*Wholesale trade*—Includes the total number of paid employees in the work week nearest November 15, and the number of active proprietors of unincorporated businesses. Estimates of the number of paid employees for 1972, 1967, and 1963, and active proprietors of unincorporated businesses for 1967 and 1963 were derived from data in the 1972, 1967, and 1963 *Censuses of Wholesale Trade*. Estimates of the number of proprietors of unincorporated businesses by State for 1972 were based on trends in similar data for 1967 and 1963. Estimates of employment attributed to timber were derived by adjusting total employment in wholesale trade by the estimated proportion of total sales that were derived by adjusting total employment in wholesale trade by the estimated proportion of total sales that were derived from timber products. These ratios were calculated, by State, from data on sales by commodity line from the 1972, 1967, and 1963 *Censuses of Wholesale Trade*. Separate estimates were made for merchant wholesalers, merchandise agents and brokers, and manufacturer's sales branches and sales offices, and incorporated in the final ratios for all wholesale trade.

## Appendix B.

### Industry Definitions

Most of the data on primary and secondary manufacturing used in this study came from the 1963, 1967, and 1972 *Censuses of Manufactures*. Firms are classified for the manufacturing census basically according to the products they produce. Thus, an establishment is classified in a particular industry (SIC) if its production of the primary products of that industry exceeds in value its production of products of any other single industry. While some establishments produce only the primary products of the industry in which they are classified, rarely do all the establishments in an industry specialize to that extent. For example, only 94 percent of the total value of shipments from those firms classified in the Wood Household Furniture Industry (SIC 2511) in 1972, was wood household furniture. The remaining 6 percent consisted of such diverse products as metal office and household furniture, hardwood dimension and flooring, games, toys, sporting and athletic goods, and household cooking equipment. Looked at from the product viewpoint, about 95 percent of the total value of shipments of wood household furniture in 1972 came from firms classified in the Wood Household Furniture Industry. In addition, wood household furniture was produced in the Upholstered and Metal Furniture Industries (SIC's 2512 and 2514), the Mattresses and Bedsprings Industry (SIC 2515), and in several others.

The types of firms (by SIC industry codes) included in the major primary and secondary manufacturing industries recognized in this study are shown in table B-1 on page 83 and defined below. Changes necessitated by SIC industry reclassification during the study period are shown in the footnotes to table B-1 and discussed below.

#### Primary Manufacturing

##### Sawmills and planing mills:

- 2421 *Sawmills and Planing Mills, General*—Establishments primarily engaged in sawing rough lumber and timber from logs and bolts or resawing cants and flitches into lumber, including box lumber and softwood cut stock; planing mills combined with sawmills; and separately operated planing mills which are engaged primarily in producing surfaced lumber and standard workings or patterns of lumber. Includes establishments primarily engaged in sawing lath and railroad ties, and in producing tobacco hoghead stock, wood chips, and snow fence lath.
- 2426 *Hardwood Dimension and Flooring*—Establishments primarily engaged in manufacturing hardwood dimension lumber and workings therefrom; and other hardwood dimension, semifabricated or ready for assembly; hardwood flooring; and wood

frames for household furniture. Establishments primarily engaged in manufacturing wood frames for household furniture, added to this SIC in 1972, were classified in industry 2512, Upholstered Household Furniture, in 1967 and 1963.

##### Veneer and plywood plants:

- 2432 *Veneer and Plywood*—Establishments primarily engaged in producing commercial veneer, either face or technical, and those primarily engaged in manufacturing commercial plywood, including nonwood backed or faced veneer and nonwood faced plywood, from veneer produced in the same establishment or from purchased veneer (1967 and 1963 only).
- 2435 *Hardwood Veneer and Plywood*—Establishments primarily engaged in producing commercial hardwood veneer, either face or technical, and those primarily engaged in manufacturing commercial plywood or prefinished hardwood plywood. This includes nonwood backed or faced veneer and nonwood faced plywood from veneer produced in the same establishment or from purchased veneer. This SIC was created in 1972 when former SIC 2432, Veneer and Plywood, was split into separate hardwood and softwood industries.
- 2436 *Softwood Veneer and Plywood*—Establishments primarily engaged in producing commercial softwood veneer and plywood, from veneer produced in the same establishment or from purchased veneer. This SIC was created in 1972 when former SIC 2432, Veneer and Plywood, was split into separate hardwood and softwood industries.

##### Pulp, paper, and paperboard mills:

- 2611 *Pulpmills*—Establishments primarily engaged in manufacturing pulp from wood or from other materials such as rags, linters, waste paper, bagasse, and straw.
- 2621 *Papermills, Except Building Paper*—Establishments primarily engaged in manufacturing paper, except building paper (Industry 2661) from woodpulp and other fibers, and which may also manufacture converted paper products. Pulpmills combined with papermills and not separately reported are also included.
- 2631 *Paperboard Mills*—Establishments primarily engaged in manufacturing paperboard, including paperboard coated on the paperboard machine, from woodpulp, waste paper, and other fibers; and which may also manufacture converted paperboard products. Pulpmills combined with paper-

board mills and not separately reported are also included.

- 2661 *Building Paper and Board Mills*—Establishments primarily engaged in manufacturing building paper and building board from wood pulp and other fibrous materials. Pulpmills combined with building paper and building board mills, and not separately reported, are also included.

#### Other primary:

- 2429 *Special Product Sawmills, N.E.C.*—Establishments primarily engaged in manufacturing excelsior, wood shingles, and cooperage stock; and in sawing special products, not elsewhere classified.
- 2492 *Particleboard*—Establishments primarily engaged in manufacturing wood panel products from small wood particles. Manufacture may take place in hydraulic presses with heated platens or by extrusion. This SIC was created in 1972. Establishments classified in this SIC were formerly part of 2499, Wood Products, N.E.C.
- 2861 *Gum and Wood Chemicals*—Establishments primarily engaged in manufacturing hardwood and softwood distillation products, wood and gum naval stores, charcoal, natural dyestuffs, and natural tanning materials.

## Secondary Manufacturing

### Millwork and prefabricated wood products:

- 2431 *Millwork*—Establishments primarily engaged in manufacturing fabricated millwork. Planing mills primarily engaged in producing millwork are included, but planing mills primarily producing standard workings or patterns of lumber are classified in SIC 2421, Sawmills and Planing Mills, General. In 1967 and 1963, this SIC also included the manufacture of custom cabinetwork to be built-in, which was transferred to new SIC 2434, Wood Kitchen Cabinets, in 1972.
- 2433 *Prefabricated Wood Structures*—Establishments primarily engaged in manufacturing prefabricated wood buildings, sections, and panels; or in producing laminated or fabricated trusses, arches, and other structural members of lumber (1967 and 1963 only).
- 2434 *Wood Kitchen Cabinets*—Establishments primarily engaged in manufacturing wood kitchen cabinets, stock line or custom, and vanities and other cabinetwork. This SIC was created in 1972 by combining the manufacture of custom cabinetwork to be built-in from former SIC 2431 with wood kitchen cabinets from former SIC 2511.

- 2439 *Structural Wood Members, N.E.C.*—Establishments primarily engaged in producing laminated or fabricated trusses, arches, and other structural members of lumber. This SIC was created in 1972. Establishments now classified in this SIC were in SIC 2433, Prefabricated Wood Structures, in 1967 and 1963.

- 2451 *Mobile Homes*—Establishments primarily engaged in manufacturing mobile homes. These mobile homes are generally over 35 feet long, at least 8 feet wide, do not have facilities for storage of water or waste, and are equipped with wheels. This SIC was created in 1972. Establishments now classified in this SIC were formerly in SIC 3791, Trailer Coaches.

- 2452 *Prefabricated Wood Buildings*—Establishments primarily engaged in manufacturing prefabricated wood buildings, sections, and panels. This SIC was created in 1972. Establishments now classified in this SIC were formerly in SIC 2433, Prefabricated Wood Structures.

- 3791 *Trailer Coaches*—Establishments primarily engaged in manufacturing trailer coaches (mobile dwellings) for attachment to passenger cars, and pickup coaches (campers) for mounting on pickup trucks.

### Wooden containers:

- 2441 *Nailed Wood Boxes and Shook*—Establishments primarily engaged in manufacturing nailed and lock-corner wooden boxes (lumber or plywood), which also may produce shook for nailed and lock-corner boxes.
- 2442 *Wirebound Boxes and Crates*—Establishments primarily engaged in manufacturing wirebound boxes and crates (1967 and 1963 only).
- 2443 *Veneer and Plywood Containers*—Establishments primarily engaged in manufacturing veneer and plywood containers, except boxes, including baskets made primarily of veneer and splint for shipping and marketing fruits and vegetables (1967 and 1963 only).
- 2445 *Cooperage*—Establishments primarily engaged in the manufacture of barrels, tubs, hogshead, and other containers made of staves, except fruit and vegetable baskets (1967 and 1963 only).
- 2448 *Wood Pallets and Skids*—Establishments primarily engaged in manufacturing wood and wood-metal combination pallets and skids. This SIC was created in 1972. Establishments classified in this SIC were formerly in SIC 2499, Wood Products, N.E.C.

2449 *Wood Containers, N.E.C.*—Establishments primarily engaged in manufacturing wood containers, not elsewhere classified, such as cooperage, wirebound boxes and crates, and other veneer and plywood containers. This SIC was created in 1972 by combining former SIC's 2442, Wirebound Boxes and Crates; 2443, Veneer and Plywood Containers; and 2445, Cooperage.

## Furniture:

2511 *Wood Household Furniture*—Establishments primarily engaged in manufacturing wood household furniture commonly used in dwellings. Also included are establishments engaged in manufacturing infants' and children's wood furniture and wood outdoor furniture. In 1967 and 1963, this SIC also included establishments primarily engaged in the manufacture of wood kitchen cabinets (transferred to SIC 2434 in 1972) and those primarily engaged in manufacturing wood, TV, radio, phonograph, and sewing machine cabinets (transferred to SIC 2517 in 1972.)

2512 *Upholstered Household Furniture*—Establishments primarily engaged in manufacturing upholstered furniture on wood frames. In 1963 and 1967, this SIC also included those firms primarily engaged in manufacturing only wood frames for upholstered furniture. In 1972 these establishments were included in SIC 2426.

2514 *Metal Household Furniture*—Establishments primarily engaged in manufacturing metal household furniture, whether padded or plain, of a type commonly used in dwellings.

2515 *Mattresses and Bedspings*—Establishments primarily engaged in manufacturing innerspring mattresses, box spring mattresses, and noninnerspring mattresses containing felt, foam rubber, or any other filling material; and assembled wire springs (fabric, coil, or box) for use on beds, couches, and cots. This SIC also includes establishments primarily engaged in manufacturing dual-purpose sleep furniture, such as studio couches, sofa beds, and chairbeds regardless of the material used in the frame.

2517 *Wood TV and Radio Cabinets*—Establishments primarily engaged in manufacturing wood radio, phonograph, hi-fi, and television cabinets. This SIC also includes establishments primarily engaged in manufacturing sewing machine cabinets. This SIC was created in 1972. Establishments now classified in this SIC were formerly in 2511, Wood Household Furniture.

2519 *Household Furniture, N.E.C.*—Establishments primarily engaged in manufacturing reed, rattan, and other wicker furniture, plastics and fiberglass household furniture and cabinets, and household furniture, N.E.C.

2521 *Wood Office Furniture*—Establishments primarily engaged in manufacturing wood office furniture whether padded, upholstered, or plain.

2531 *Public Building and Related Furniture*—Establishments primarily engaged in manufacturing furniture for schools, theaters, assembly halls, churches, and libraries, and also including the manufacture of seats for public conveyance and seats for automobiles and aircraft.

2541 *Wood Partitions and Fixtures*—Establishments primarily engaged in manufacturing wood shelving, lockers, office and store fixtures, prefabricated plastic laminated fixture tops, and related fabricated products.

2542 *Metal Partitions and Fixtures*—Establishments primarily engaged in manufacturing metal shelving, storage racks, lockers, office and store fixtures, prefabricated partitions, and related fabricated products.

2599 *Furniture and Fixtures, N.E.C.*—Establishments primarily engaged in manufacturing furniture and fixtures, not elsewhere classified, including furniture especially designed for use in restaurants, bars, cafeterias, bowling establishments, and ships.

## Paper and paperboard products:

2641 *Paper Coating and Glazing*—Establishments primarily engaged in manufacturing coated, glazed, or varnished paper from purchased paper. Also included are establishments primarily manufacturing pressure sensitive tape with backing of any material other than rubber.

2642 *Envelopes*—Establishments primarily engaged in manufacturing envelopes of any description from purchased paper and paperboard.

2643 *Bags, Except Textile Bags*—Establishments primarily engaged in manufacturing bags from purchased paper, cellophane, acetate, polyethylene, polypropylene, pliofilm, foil, and similar sheet or film materials.

2644 *Wallpaper*—Establishments primarily engaged in designing, printing, and embossing paper for interior walls and ceilings (1967 and 1963 only).

- 2645 *Die-cut Paper and Board*—Establishments primarily engaged in diecutting purchased paper and paperboard; and in manufacturing cardboard by laminating, lining, or surface coating paperboard.
- 2646 *Pressed and Molded Pulp Goods*—Establishments primarily engaged in manufacturing all kinds of pressed and molded goods, including papier-mache articles other than statuary and art goods.
- 2647 *Sanitary Paper Products*—Establishments primarily engaged in manufacturing, from purchased paper, sanitary paper products, such as facial tissue and hankiechiefs, table napkins, toilet paper, towels, disposable diapers, and sanitary napkins and tampons. In 1967 and 1963, firms manufacturing disposable paper diapers were in 2399, Fabricated Textile Products, N.E.C.
- 2648 *Stationery Products*—Establishments primarily engaged in manufacturing stationery, tablets, looseleaf fillers, and related items from purchased paper. This SIC was created in 1972. Establishments now classified in this SIC were formerly in 2649, Converted Paper Products, N.E.C.
- 2649 *Converted Paper Products N.E.C.*—Establishments primarily engaged in manufacturing from purchased paper or paperboard, miscellaneous converted paper or paperboard products, not elsewhere classified. Includes firms manufacturing wallpaper in 1972, formally in 2644 in 1967 and 1963.
- 2651 *Folding Paperboard Boxes*—Establishments primarily engaged in manufacturing folding paperboard boxes from purchased paperboard.
- 2652 *Set-up Paperboard Boxes*—Establishments primarily engaged in manufacturing setup paperboard boxes from purchased paperboard.
- 2653 *Corrugated and Solid Fiber Boxes*—Establishments primarily engaged in manufacturing corrugated and solid fiber boxes and related products from purchased paperboard of fiber stock. Important products of this industry include corrugated and solid fiberboard boxes, pads, partitions, display items, pallets, single face products, and corrugated sheets.
- 2654 *Sanitary Food Containers*—Establishments primarily engaged in manufacturing food containers from special food board. Important products of this industry include fluid milk containers; folding paraffined cartons for butter, margarine, and shortening; ice cream containers; frozen food containers; liquid tight containers; dishes, spoons, and similar products.
- 2655 *Fiber Cans, Drums, and Similar Products*—Establishments primarily engaged in manufacturing

from purchased materials fiber cans, cones, drums, and similar products, with or without metal ends, and vulcanized fiber boxes.

#### Fibers, plastics and textiles:

- 2211 *Weaving Mills, Cotton*—Establishments primarily engaged in weaving fabrics over 12 inches in width, wholly or chiefly of cotton.
- 2221 *Weaving Mills, Man-Made Fiber, Silk*—Establishments primarily engaged in weaving fabrics over 12 inches in width, wholly or chiefly of silk and manmade fibers, including glass.
- 2241 *Narrow Fabric Mills*—Establishments primarily engaged in weaving or braiding fabrics 12 inches in width or narrower of cotton, wool, silk, and manmade fibers, including glass.
- 2253 *Knit Outerwear Mills*—Establishments primarily engaged in knitting outerwear from yarn or in manufacturing outerwear from knit fabric produced in the same establishment.
- 2254 *Knit Underwear Mills*—Establishments primarily engaged in knitting underwear and nightwear from yarn or in manufacturing underwear and nightwear from knit fabric produced in the same establishment.
- 2256 *Knit Fabric Mills*—Establishments primarily engaged in knitting tubular or flat fabric and in dyeing or finishing knit fabric (1967 and 1963 only).
- 2258 *Warp Knit Fabric Mills*—Establishments primarily engaged in knitting warp (flat fabric) or in dyeing or finishing warp (flat) knit fabric (1972 only).
- 2259 *Knitting Mills, N.E.C.*—Establishments primarily engaged in knitting gloves and other articles, not elsewhere classified.
- 2262 *Finishing Plants, Manmade Fiber and Silk*—Establishments primarily engaged in finishing purchased manmade fiber and silk broad woven fabrics or finishing such fabrics on a commission basis. These finishing operations include bleaching, dyeing, printing (roller, screen, flock, and plisse), and other mechanical finishing such as preshrinking, calendering, and napping.
- 2272 *Tufted Carpets and Rugs*—Establishments primarily engaged in tufting carpets and rugs from any textile fiber. Important products of this industry include tufted carpets, rugs, scatter rugs, and bathmats and bathmat sets except terry woven.
- 2281 *Yarn Mills, Except Wool*—Establishments primarily engaged in spinning yarn wholly or chiefly by weight of cotton, manmade fibers, or silk staple.

- 2282 *Throwing and Winding Mills*—Establishments primarily engaged in texturizing, throwing, twisting, winding, or spooling yarn wholly or chiefly by weight of cotton, manmade fibers, or silk.
- 2284 *Thread Mills*—Establishments primarily engaged in manufacturing thread from natural or man-made fiber except flax and wool.
- 2294 *Processed Textile Waste*—Establishments primarily engaged in processing textile mill waste for spinning, padding, batting, or other uses; in recovering textile fibers from clippings and rags; in cutting flock from waste, recovered fibers, or new fiber stock, and in manufacturing oakum and twisted jute packing.
- 2296 *Tire Cord and Fabric*—Establishments primarily engaged in manufacturing cord and fabric for use in reinforcing rubber tires, industrial belting, fuel cells, and similar uses.
- 2297 *Nonwoven Fabric Mills*—Establishments primarily engaged in manufacturing nonwoven fabrics (by bonding and/or interlocking of fibers) by mechanical, chemical, thermal, or solvent means or by combinations thereof; or in manufacturing nonwoven fabricated products such as blankets, ribbons, and wipers (1972 only).
- 2298 *Cordage and Twine*—Establishments primarily engaged in manufacturing rope, cable, cordage, twine, and related products from abaca (Manila), sisal, henequen, hemp, cotton, paper, jute, flax, manmade fibers including glass, and other fibers.
- 2311 *Men's and Boys' Suits and Coats*—Establishments primarily engaged in the manufacture of men's, youths', and boys' suits, coats, and overcoats. Establishments primarily engaged in manufacturing uniforms (except athletic) are also included in this industry.
- 2321 *Men's and Boys' Shirts and Nightwear*—Establishments primarily engaged in the manufacture of men's and boys' shirts (including polo and sports shirts) and nightwear cut and sewed from purchased woven or knit fabrics.
- 2323 *Men's and Boys' Neckwear*—Establishments primarily engaged in the manufacture of men's and boys' neckties, scarfs, and mufflers cut and sewed from purchased woven or knit fabric.
- 2327 *Men's and Boys' Separate Trousers*—Establishments primarily engaged in the manufacture of men's and boys' separate trousers and slacks.
- 2329 *Men's and Boys' Clothing, N.E.C.*—Establishments primarily engaged in manufacturing men's, youths' and boys' clothing, not elsewhere classified.
- 2331 *Women's and Misses' Blouses and Waists*—Establishments primarily engaged in manufacturing women's, misses' and juniors' blouses, waists, and shirts.
- 2335 *Women's and Misses' Dresses*—Establishments primarily engaged in manufacturing women's, misses' and juniors' dresses, including ensemble dresses and pants dresses, whether sold by the piece or by the dozen.
- 2337 *Women's and Misses' Suits and Coats*—Establishments primarily engaged in manufacturing women's, misses', and juniors' suits, pantsuits, skirts, and coats except fur coats and raincoats. These garments are generally tailored and usually lined.
- 2341 *Women's and Children's Underwear*—Establishments primarily engaged in manufacturing women's, misses', children's, and infant's underwear and nightwear cut and sewed from purchased woven or knit fabric.
- 2361 *Children's Dresses and Blouses*—Establishments primarily engaged in manufacturing girls', children's, and infants' dresses, blouses, waists, and shirts, cut and sewed from purchased woven or knit fabric.
- 2363 *Children's Coats and Suits*—Establishments primarily engaged in manufacturing girls', children's, and infants' coats and suits, cut and sewed from purchased woven or knit fabric.
- 2369 *Children's Outerwear, N.E.C.*—Establishments primarily engaged in manufacturing girls', children's, and infants' outerwear not elsewhere classified, cut and sewed from woven or knit fabric.
- 2384 *Robes and Dressing Gowns*—Establishments primarily engaged in manufacturing men's and women's robes and dressing gowns.
- 2391 *Curtains and Draperies*—Establishments primarily engaged in manufacturing curtains and draperies from purchased materials.
- 2392 *House Furnishings, N.E.C.*—Establishments primarily engaged in manufacturing house furnishings such as blankets, bedspreads, sheets, tablecloths, and towels from purchased materials.
- 2394 *Canvas and Related Products*—Establishments primarily engaged in manufacturing awnings, tents, and related products from purchased fabric.
- 2399 *Fabricated Textile Products, N.E.C.*—Establishments primarily engaged in manufacturing fabricated textile products, not elsewhere classified.
- 2821 *Plastic Materials and Resins*—Establishments primarily engaged in manufacturing synthetic resins, plastics materials, and nonvulcanizable elastomers. Important products of this industry include cellulose plastic materials.
- 2823 *Cellulosic Manmade Fibers*—Establishments primarily engaged in manufacturing cellulose fibers (including cellulose acetate and regenerated

cellulose such as rayon, by the viscose or cuprammonium process) in the form of monofilament, yarn, staple, or tow suitable for further manufacturing on spindles, looms, knitting machines, or other textile processing equipment.

**Other secondary:**

- 2491 *Wood Preserving*—Establishments primarily engaged in treating wood, sawed or planed in other establishments, with creosote or other preservatives to prevent decay and to protect against fire and insects. Also included is the cutting, treating, and selling of poles, posts, and piling, but establishments primarily engaged in manufacturing other wood products (which they may also treat with preservatives) are not included.
- 2499 *Wood Products N.E.C.*—Establishments primarily engaged in turning and shaping wood and

manufacturing miscellaneous wood products, rattan, reed, splint, straw, veneer, veneer strips, wicker, and willow. Also included are establishments manufacturing lasts and related products, cork products, hardboard, and wood or metal mirror and picture frames. In 1967 and 1963, this SIC also included establishments primarily engaged in manufacturing pallets and skids.

*Others*—In addition to the SIC's shown, the data on employment and value added attributable to timber included the value added and employment attributed to timber in plants manufacturing ships and boats, small arms, morticians' goods, sporting and athletic goods, games and toys, and many other items in which small quantities of timber and timber products were incorporated. Compilations of total value added and total employment were not made for this large and diverse group of industries since they include nearly all manufacturing industries not defined above.

Table B-1—Types of firms included in the major primary and secondary industries, 1972, 1967, and 1963.

Industry	1972	1967	1963	Industry	1972	1967	1963
<b>Primary manufacturing</b>				<b>Paper and paperboard products (cont'd)</b>			
Sawmills and planing mills				Bags, except textile bags (SIC 2643)	X	X	X
Sawmills and planing mills, general (SIC 2421)	X	X	X	Wallpaper (SIC 2644)	<sup>10</sup>	X	X
Hardwood dimension and flooring (SIC 2426)	X <sup>1</sup>	X	X	Die-cut paper and board (SIC 2645)	X	X	X
Veneer and plywood plants				Pressed and molded pulp goods (SIC 2646)	X	X	X
Veneer and plywood plants (SIC 2432)	<sup>2</sup>	X	X	Sanitary paper products (SIC 2647)	X <sup>11</sup>	X	X
Hardwood veneer and plywood plants (SIC 2435)	X <sup>3</sup>			Stationery products (SIC 2648)	X <sup>12</sup>		
Softwood veneer and plywood plants (SIC 2436)	X <sup>3</sup>			Converted paper products, nec (SIC 2649)	X <sup>10,12</sup>	X	X
Pulp, paper, and paperboard mills				Folding paperboard boxes (SIC 2651)	X	X	X
Pulp mills (SIC 2611)	X	X	X	Set-up paperboard boxes (SIC 2652)	X	X	X
Papermills except building paper (SIC 2621)	X	X	X	Corrugated and solid fiber boxes (SIC 2653)	X	X	X
Paperboard mills (SIC 2631)	X	X	X	Sanitary food containers (SIC 2654)	X	X	X
Building paper and board mills (SIC 2661)	X	X	X	Fiber cans, drums and similar products (SIC 2655)	X	X	X
<b>Other primary</b>				<b>Fibers, plastics and textile products</b>			
Special product sawmills, n.e.c. (SIC 2429)	X	X	X	Weaving mills, cotton (SIC 2211)	X	X	X
Particleboard (SIC 2492)	X	X	X	Weaving mills, synthetics (SIC 2221)	X	X	X
Gum and wood chemicals (SIC 2861)	X <sup>4</sup>			Narrow fabric mills (SIC 2241)	X	X	X
<b>Secondary manufacturing</b>				Knit outerwear mills (SIC 2253)		X	X
Millwork, and prefabricated wood products				Knit underwear mills (SIC 2254)	X	X	X
Millwork (SIC 2431)	X <sup>4</sup>			Knit fabric mills (SIC 2256)	<sup>13</sup>	X	X
Prefabricated wood structures (SIC 2433)	<sup>5</sup>	X	X	Warp knit fabric mills (SIC 2258)	X <sup>13</sup>		
Wood kitchen cabinets (SIC 2434)	X <sup>4</sup>			Knitting mills, n.e.c. (SIC 2259)	X	X	X
Structural wood members, n.e.c. (SIC 2439)	X <sup>4</sup>			Finishing plants, synthetics (SIC 2262)	X	X	X
Mobile homes (SIC 2451)	X <sup>4</sup>			Tufted carpets and rugs (SIC 2272)	X	X	X
Prefabricated wood buildings (SIC 2452)	X <sup>4</sup>			Yarn mills, except wool (SIC 2281)	X	X	X
Trailer coaches (SIC 3791)	<sup>6</sup>	X	X	Throwing and winding mills (SIC 2282)	X	X	X
Wooden containers				Thread mills (SIC 2284)	X	X	
Nailed wood boxes and shooks (SIC 2441)	X	X	X	Processed textile waste (SIC 2294)			
Wirebound boxes and crates (SIC 2442)	<sup>7</sup>	X	X	Tire cord and fabric (SIC 2296)	X	X	X
Veneer and plywood containers (SIC 2443)	<sup>7</sup>	X	X	Nonwoven fabric mills (SIC 2297)	X	X	X
Cooperage (SIC 2445)	<sup>7</sup>	X	X	Cordage and twine (SIC 2298)	X <sup>14</sup>		
Wood pallets and skids (SIC 2448)	X <sup>8</sup>			Men's and boy's suits and coats (SIC 2311)	X	X	X
Wood containers, n.e.c. (SIC 2449)	X <sup>8</sup>			Men's and boy's shirts and nightwear (SIC 2321)	X	X	X
<b>Furniture</b>				Men's and boy's neckwear (SIC 2323)	X	X	X
Wood household furniture (SIC 2511)	X <sup>9</sup>	X	X	Men's and boy's separate trousers (SIC 2327)	X	X	X
Upholstered household furniture (SIC 2512)	X <sup>9</sup>	X	X	Men's and boy's clothing, n.e.c. (SIC 2329)	X	X	X
Matel household furniture (SIC 2514)	X	X	X	Women's, misses' blouses and waists (SIC 2331)	X	X	X
Mattresses and bedsprings (SIC 2515)	X	X	X	Women's, misses' dresses (SIC 2335)	X	X	X
Wood TV and radio cabinets (SIC 2517)	X <sup>9</sup>			Women's, misses' suits, skirts, coats (SIC 2337)	X	X	X
Household furniture, n.e.c. (SIC 2519)	X	X	X	Women's and children's underwear (SIC 2341)	X	X	X
Wood office furniture (SIC 2521)	X	X	X	Children's dresses and blouses (SIC 2361)	X	X	X
Public building and related furniture (SIC 2531)	X	X	X	Children's coats and suits (SIC 2363)	X	X	X
Wood partitions and fixtures (SIC 2541)	X	X	X	Children's outerwear, n.e.c. (SIC 2369)	X	X	X
Metal partitions and fixtures (SIC 2542)	X	X	X	Robes and dressing gowns (SIC 2384)	X	X	X
Furniture and fixtures, n.e.c. (SIC 2599)	X	X	X	Curtains and draperies (SIC 2391)	X	X	X
<b>Paper and paperboard products</b>				House furnishings, n.e.c. (SIC 2392)	X	X	X
Paper coating and glazing (SIC 2641)	X	X	X	Canvas products (SIC 2394)	X	X	X
Envelopes (SIC 2642)	X	X	X	Fabricated textile products, n.e.c. (SIC 2399)	X	X	X
				Plastics materials and resins (SIC 2821)	X	X	X
				Cellulosic man-made fibers (SIC 2823)		X	X
				Other secondary	X	X	X
				Wood preserving (SIC 2491)	X	X	X
				Wood products, n.e.c. (SIC 2499)	X <sup>14</sup>	X	X
				Others	X	X	X

<sup>1</sup> In 1972, SIC 2426 includes wood furniture frame manufacture which was a part of SIC 2512 in 1967 and 1963.

<sup>2</sup> In 1967 and 1963, both hardwood and softwood veneer and plywood plants were in SIC 2432.

<sup>3</sup> In 1967 and 1963, particleboard was a part of SIC 2499.

<sup>4</sup> In 1972, new SIC 2434 was established by combining wood kitchen cabinets to be built in from 2431 and other wood kitchen cabinets from 2511.

<sup>5</sup> In 1967 and 1963, structural wood members, n.e.c. and prefabricated wood buildings were in SIC 2433.

<sup>6</sup> In 1967 and 1963, mobile home manufacture was a part of SIC 3791.

<sup>7</sup> In 1972, former SIC's 2442, 2443, and 2445 were combined in 2449.

<sup>8</sup> In 1967 and 1963, wood pallets and skids manufacture was a part of 2499.

<sup>9</sup> In 1967 and 1963, wood TV and radio cabinet manufacture was a part of 2511.

<sup>10</sup> In 1972, wallpaper manufacture was a part of 2649.

<sup>11</sup> In 1972, includes paper disposable diapers which were a part of 2399 in 1967 and 1963.

<sup>12</sup> In 1967 and 1963, stationery product manufacture was a part of 2649.

<sup>13</sup> In 1967 and 1963, warp knit fabric mills were a part of 2256.

<sup>14</sup> In 1967 and 1963, nonwoven fabric mills were a part of 2299.
